

Donor 7425

Genetic Testing Summary

Fairfax Cryobank recommends reviewing this genetic testing summary with your healthcare provider to determine suitability.

Last Updated: 10/29/24

Donor Reported Ancestry: Spanish, Italian, Polish

Jewish Ancestry: No

Genetic Test*	Result	Comments/Donor's Residual Risk**
Chromosome analysis (karyotype)	Normal male karyotype	No evidence of clinically significant chromosome abnormalities
Hemoglobin evaluation	Normal hemoglobin fractionation and MCV/MCH results	Reduced risk to be a carrier for sickle cell anemia, beta thalassemia, alpha thalassemia trait (aa/-- and a-/a-) and other hemoglobinopathies
Expanded Genetic Disease Carrier Screening Panel attached- 549 diseases by gene sequencing.	Carrier: Gitelman Syndrome (SLC12A3) Negative for other genes sequenced.	Partner testing is recommended before using this donor.

*No single test can screen for all genetic disorders. A negative screening result significantly reduces, but cannot eliminate, the risk for these conditions in a pregnancy.

**Donor residual risk is the chance the donor is still a carrier after testing negative.

Patient Information

Patient Name: Donor 7425

Date Of Birth: [REDACTED]

Gender: Male

Ethnicity: Northern European
Caucasian

Patient ID: N/A

Medical Record #: 7425-[REDACTED]

Collection Kit: [REDACTED]

Accession ID: N/A

Case File ID: [REDACTED]

Sample Type: Blood

**CARRIER SCREENING REPORT**

ABOUT THIS SCREEN: Horizon™ is a carrier screen for specific autosomal recessive and X-linked diseases. This information can help patients learn their risk of having a child with specific genetic conditions.

ORDER SELECTED: The Horizon Custom panel was ordered for this patient. Males are not screened for X-linked diseases

FINAL RESULTS SUMMARY:**CARRIER for Gitelman Syndrome**

Positive for the pathogenic variant c.473G>A (p.R158Q) in the SLC12A3 gene. Heterozygous carriers may have decreased blood pressure compared to the general population, but are not expected to develop any symptoms of the disease. If this individual's partner is a carrier for GITELMAN SYNDROME, their chance to have a child with this condition is 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

Negative for 548 out of 549 diseases

No other pathogenic variants were detected in the genes that were screened. The patient's remaining carrier risk after the negative screening results is listed for each disease/gene on the Horizon website at <https://www.natera.com/panel-option/h-all/>. Please see the following pages of this report for a comprehensive list of all conditions included on this individual's screen.

Carrier screening is not diagnostic and may not detect all possible pathogenic variants in a given gene.

RECOMMENDATIONS

Individuals who would like to review their Horizon report with a Natera Laboratory Genetic Counselor may schedule a telephone genetic information session by calling 650-249-9090 or visiting naterasession.com. Clinicians with questions may contact Natera at 650-249-9090 or email support@natera.com. Individuals with positive results may wish to discuss these results with family members to allow them the option to be screened. Comprehensive genetic counseling to discuss the implications of these test results and possible associated reproductive risk is recommended.

GITELMAN SYNDROME**Understanding Your Horizon Carrier Screen Results****What is Gitelman Syndrome?**

Gitelman Syndrome is an inherited disorder that causes kidney problems. In people with Gitelman Syndrome, the kidneys cannot filter certain substances correctly from the blood to urine. This leads to an imbalance of potassium, magnesium, and calcium in the blood. The signs and symptoms of Gitelman Syndrome vary from person to person and are often mild. Symptoms usually appear in late childhood or the teenage years and may include painful muscle spasms, muscle weakness or cramping, dizziness, and salt craving. Also common is a tingling or prickly sensation in the skin, most often on the face. Some people also have chronic tiredness, low blood pressure, an abnormal heart rhythm, and a painful joint condition called chondrocalcinosis. Treatment with magnesium salt supplements is effective in preventing or lessening the symptoms, although most people with Gitelman Syndrome never need treatment. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

What causes Gitelman Syndrome?

Gitelman Syndrome is most often caused by a gene change, or mutation, in both copies of the SLC12A3 gene pair. These mutations cause the genes to not work properly or not work at all. When both copies of this gene do not work correctly, it leads to the symptoms described above. Gitelman Syndrome is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the SLC12A3 gene to have a child with Gitelman Syndrome. People who are carriers for Gitelman Syndrome may have lower than average blood pressure, but are otherwise usually healthy and do not typically have other symptoms of Gitelman Syndrome. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Gitelman Syndrome there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their SLC12A3 gene mutations to the child, who will then have this condition. Individuals found to carry more than one mutation for Gitelman Syndrome should discuss risks to their own health and their risks for having an affected child with their health care provider.

What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for Gitelman Syndrome ordered by a health care professional. If your partner is not found to be a carrier for Gitelman Syndrome, your risk of having a child with this condition is reduced. Couples at risk of having a baby with Gitelman Syndrome can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth. If you are not yet pregnant, your partner can have carrier screening for Gitelman Syndrome ordered by a health care professional. If your partner is found to be a carrier for Gitelman Syndrome, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnosis or testing the baby after birth for Gitelman Syndrome
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for Gitelman Syndrome
- Adoption or use of a sperm or egg donor who is not a carrier for Gitelman Syndrome

VARIANT DETAILS**SLC12A3, c.473G>A (p.R158Q), heterozygous, pathogenic**

- The c.473G>A (p.R158Q) variant in the SLC12A3 gene has been observed at a frequency of 0.0014% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with Gitelman syndrome (PMID: 12112667, 25852896, 30413979, 27216017).
- This variant has been reported in ClinVar [ID: 647629].

DISEASES SCREENED

Below is a list of all diseases screened and the result. Certain conditions have unique patient-specific numerical values, therefore, results for those conditions are formatted differently.

Autosomal Recessive

1

17-BETA HYDROXYSTEROID DEHYDROGENASE 3 DEFICIENCY (*HSD17B3*) **negative**

3

3-BETA-HYDROXYSTEROID DEHYDROGENASE TYPE II DEFICIENCY (*HSD3B2*) **negative**

3-HYDROXY-3-METHYLGUTARYL-COENZYME A LYASE DEFICIENCY (*HMGCL*) **negative**

3-HYDROXYACYL-COA DEHYDROGENASE DEFICIENCY (*HADH*) **negative**

3-METHYLCROTONYL-CoA CARBOXYLASE 2 DEFICIENCY (*MCCC2*) **negative**

3-PHOSPHOGLYCERATE DEHYDROGENASE DEFICIENCY (*PHGDH*) **negative**

5

5-ALPHA-REDUCTASE DEFICIENCY (*SRD5A2*) **negative**

6

6-PYRUVYL-TETRAHYDROPTERIN SYNTHASE (*PTPS*) DEFICIENCY (*PTS*) **negative**

A

ABCA4-RELATED CONDITIONS (*ABCA4*) **negative**

ABETALIPOPROTEINEMIA (*MTTP*) **negative**

ACHONDROGENESIS, TYPE 1B (*SLC26A2*) **negative**

ACHROMATOPSIA, CNGB3-RELATED (*CNGB3*) **negative**

ACRODERMATITIS ENTEROPATHICA (*SLC39A4*) **negative**

ACTION MYOCLONUS-RENAL FAILURE (AMRF) SYNDROME (*SCARB2*) **negative**

ACUTE INFANTILE LIVER FAILURE, TRMU-RELATED (*TRMU*) **negative**

ACYL-COA OXIDASE I DEFICIENCY (*ACOX1*) **negative**

AICARDI-GOUTIERES SYNDROME (*SAMHD1*) **negative**

AICARDI-GOUTIERES SYNDROME, RNASEH2A-RELATED (*RNASEH2A*) **negative**

AICARDI-GOUTIERES SYNDROME, TREX1-RELATED (*TREX1*) **negative**

ALPHA-MANNOSIDOSIS (*MAN2B1*) **negative**

ALPHA-THALASSEMIA (*HBA1/HBA2*) **negative**

ALPORT SYNDROME, COL4A3-RELATED (*COL4A3*) **negative**

ALPORT SYNDROME, COL4A4-RELATED (*COL4A4*) **negative**

ALSTROM SYNDROME (*ALMS1*) **negative**

AMISH INFANTILE EPILEPSY SYNDROME (*ST3GAL5*) **negative**

ANDERMANN SYNDROME (*SLC12A6*) **negative**

ARGININE:GLYCINE AMIDINOTRANSFERASE DEFICIENCY (AGAT DEFICIENCY) (*GATM*) **negative**

ARGININEMIA (*ARG1*) **negative**

ARGININOSUCCINATE LYASE DEFICIENCY (*ASL*) **negative**

AROMATASE DEFICIENCY (*CYP19A1*) **negative**

ASPARAGINE SYNTHETASE DEFICIENCY (*ASNS*) **negative**

ASPARTYLGLYCOSAMINURIA (AGA) **negative**

ATAXIA WITH VITAMIN E DEFICIENCY (*TTPA*) **negative**

ATAXIA-TELANGECTASIA (*ATM*) **negative**

ATAXIA-TELANGECTASIA-LIKE DISORDER 1 (*MRE11*) **negative**

ATRAUSFERRINEMIA (*TF*) **negative**

AUTISM SPECTRUM, EPILEPSY AND ARTHROGRYPOSIS (*SLC35A3*) **negative**

AUTOIMMUNE POLYGLANDULAR SYNDROME, TYPE 1 (*AIRE*) **negative**

AUTOSOMAL RECESSIVE CONGENITAL ICHTHYOSIS (ARCI), SLC27A4-RELATED (*SLC27A4*) **negative**

AUTOSOMAL RECESSIVE SPASTIC ATAXIA OF CHARLEVOIX-SAGUENAY (SACS) **negative**

BIOTINIDASE DEFICIENCY (*BTD*) **negative**

BIOTIN-THIAMINE-RESPONSIVE BASAL GANGLIA DISEASE (BTBGD) (*SLC19A3*) **negative**

BLOOM SYNDROME (*BLM*) **negative**

BRITTLE CORNEA SYNDROME 1 (*ZNF469*) **negative**

BRITTLE CORNEA SYNDROME 2 (*PRDM5*) **negative**

C

CANAVAN DISEASE (*ASPA*) **negative**

CARBAMOYL PHOSPHATE SYNTHETASE I DEFICIENCY (*CPS1*) **negative**

CARNITINE DEFICIENCY (*SLC22A5*) **negative**

CARNITINE PALMITOYLTRANSFERASE IA DEFICIENCY (*CPT1A*) **negative**

CARNITINE PALMITOYLTRANSFERASE II DEFICIENCY (*CPT2*) **negative**

CARNITINE-ACYLCARNITINE TRANSLOCASE DEFICIENCY (*SLC25A20*) **negative**

CARPENTER SYNDROME (*RAB23*) **negative**

CARTILAGE-HAIR HYPOPLASIA (*RMRP*) **negative**

CATECHOLAMINERGIC POLYMORPHIC VENTRICULAR TACHYCARDIA (*CASQ2*) **negative**

CD59-MEDIATED HEMOLYTIC ANEMIA (*CD59*) **negative**

CEP152-RELATED MICROCEPHALY (*CEP152*) **negative**

CEREBRAL DYSGENESIS, NEUROPATHY, ICHTHYOSIS, AND PALMOPLANTAR

KERATODERMA (CEDNIK) SYNDROME (*SNAP29*) **negative**

CEREBROTENDINOUS XANTHOMATOSIS (*CYP27A1*) **negative**

CHARCOT-MARIE-TOOTH DISEASE, RECESSIVE INTERMEDIATE C (*PLEKHG5*) **negative**

CHARCOT-MARIE-TOOTH-DISEASE, TYPE 4D (*NDRG1*) **negative**

CHEDIAK-HIGASHI SYNDROME (*LYST*) **negative**

CHOREOACANTHOCYTOSIS (*VPS13A*) **negative**

CHRONIC GRANULOMATOUS DISEASE, CYBA-RELATED (*CYBA*) **negative**

CHRONIC GRANULOMATOUS DISEASE, NCF2-RELATED (*NCF2*) **negative**

Testing Methodology, Limitations, and Comments:**Next-generation sequencing (NGS)**

Sequencing library prepared from genomic DNA isolated from a patient sample is enriched for targets of interest using standard hybridization capture protocols and PCR amplification (for targets specified below). NGS is then performed to achieve the standards of quality control metrics, including a minimum coverage of 99% of targeted regions at 20X sequencing depth. Sequencing data is aligned to human reference sequence, followed by deduplication, metric collection and variant calling (coding region +/- 20bp). Variants are then classified according to ACMGG/AMP standards of interpretation using publicly available databases including but not limited to ENSEMBL, HGMD Pro, ClinGen, ClinVar, 1000G, ESP and gnomAD. Variants predicted to be pathogenic or likely pathogenic for the specified diseases are reported. It should be noted that the data interpretation is based on our current understanding of the genes and variants at the time of reporting. Putative positive sequencing variants that do not meet internal quality standards or are within highly homologous regions are confirmed by Sanger sequencing or gene-specific long-range PCR as needed prior to reporting.

Copy Number Variant (CNV) analysis is limited to deletions involving two or more exons for all genes on the panel, in addition to specific known recurrent single-exon deletions. CNVs of small size may have reduced detection rate. This method does not detect gene inversions, single-exonic and sub-exonic deletions (unless otherwise specified), and duplications of all sizes (unless otherwise specified). Additionally, this method does not define the exact breakpoints of detected CNV events. Confirmation testing for copy number variation is performed by specific PCR, Multiplex Ligation-dependent Probe Amplification (MLPA), next generation sequencing, or other methodology.

This test may not detect certain variants due to local sequence characteristics, high/low genomic complexity, homologous sequence, or allele dropout (PCR-based assays). Variants within noncoding regions (promoter, 5'UTR, 3'UTR, deep intronic regions, unless otherwise specified), small deletions or insertions larger than 25bp, low-level mosaic variants, structural variants such as inversions, and/or balanced translocations may not be detected with this technology.

SPECIAL NOTES

For ABCC6, variants in exons 1-9 are not detected due to the presence of regions of high homology.

For CFTR, when the CFTR R117H variant is detected, reflex analysis of the polythymidine variations (5T, 7T and 9T) at the intron 9 branch/acceptor site of the CFTR gene will be performed.

For CYP21A2, targets were enriched using long-range PCR amplification, followed by next generation sequencing. Duplication analysis will only be performed and reported when c.955C>T (p.Q319*) is detected. Sequencing and CNV analysis may have reduced sensitivity, if variants result from complex rearrangements, in trans with a gene deletion, or CYP21A2 gene duplication on one chromosome and deletion on the other chromosome. This analysis cannot detect sequencing variants located on the CYP21A2 duplicated copy.

For DDX11, only NM_030653.3:c.1763 - 1G > C variant will be analyzed and reported.

For HBA1/HBA2, CNV analysis is offered to detect common deletions of -alpha3.7, -alpha4.2, --MED, --SEA, --FIL, --THAI, --alpha20.5, and/or HS-40.

For OTOA, variants in exons 20 - 28 are not analyzed due to high sequence homology.

For RPGRIP1L, variants in exon 23 are not detected due to assay limitation.

For SAMD9, only p.K1495E variant will be analyzed and reported.

Friedreich Ataxia (FXN)

The GAA repeat region of the FXN gene is assessed by trinucleotide PCR assay and capillary electrophoresis. Variances of +/-1 repeat for normal alleles and up to +/-3 repeats for premutation alleles may occur. For fully penetrant expanded alleles, the precise repeat size cannot be determined, therefore the approximate allele size is reported. Sequencing and copy number variants are analyzed by next-generation sequencing analysis.

Friedreich Ataxia Repeat Categories

Categories	GAA Repeat Sizes
Normal	<34
Premutation	34 - 65
Full	>65

Spinal Muscular Atrophy (SMN1)

The total combined copy number of SMN1 and SMN2 exon 7 is quantified based on NGS read depth. The ratio of SMN1 to SMN2 is calculated based on the read depth of a single nucleotide that distinguishes these two genes in exon 7. In addition to copy number analysis, testing for the presence or absence of a single nucleotide polymorphism (g.27134T>G in intron 7 of SMN1) associated with the presence of a SMN1 duplication allele is performed using NGS.

Ethnicity	Two SMN1 copies carrier risk before g.27134T>G testing	Carrier risk after g.27134T>G testing	
		g.27134T>G ABSENT	g.27134T>G PRESENT
Caucasian	1 in 632	1 in 769	1 in 29
Ashkenazi Jewish	1 in 350	1 in 580	LIKELY CARRIER
Asian	1 in 628	1 in 702	LIKELY CARRIER
African-American	1 in 121	1 in 396	1 in 34
Hispanic	1 in 1061	1 in 1762	1 in 140

Variant Classification

Only pathogenic or likely pathogenic variants are reported. Other variants including benign variants, likely benign variants, variants of uncertain significance, or inconclusive variants identified during this analysis may be reported in certain circumstances. Our laboratory's variant classification criteria are based on the ACMG and internal guidelines and our current understanding of the specific genes. This interpretation may change over time as more information about a gene and/or variant becomes available. Natera and its lab partner(s) may reclassify variants at certain intervals but may not release updated reports without a specific request made to Natera by the ordering provider. Natera may disclose incidental findings if deemed clinically pertinent to the test performed.

Negative Results

A negative carrier screening result reduces the risk for a patient to be a carrier of a specific disease but does not completely rule out carrier status. Please visit <https://www.natera.com/panel-option/h-all/> for a table of carrier rates, detection rates, residual risks and promised variants/exons per gene. Carrier rates before and after testing vary by ethnicity and assume a negative family history for each disease screened and the absence of clinical symptoms in the patient. Any patient with a family history for a specific genetic disease will have a higher carrier risk prior to testing and, if the disease-causing mutation in their family is not included on the test, their carrier risk would remain unchanged. Genetic counseling is recommended for patients with a family history of genetic disease so that risk figures based on actual family history can be determined and discussed along with potential implications for reproduction. Horizon carrier screening has been developed to identify the reproductive risks for monogenic inherited conditions. Even when one or both members of a couple screen negative for pathogenic variants in a specific gene, the disease risk for their offspring is not zero. There is still a low risk for the condition in their offspring due to a number of different mechanisms that are not detected by Horizon including, but not limited to, pathogenic variant(s) in the tested gene or in a different gene not included on Horizon, pathogenic variant(s) in an upstream regulator, uniparental disomy, de novo mutation(s), or digenic or polygenic inheritance.

Additional Comments

These analyses generally provide highly accurate information regarding the patient's carrier status. Despite this high level of accuracy, it should be kept in mind that there are many potential sources of diagnostic error, including misidentification of samples, polymorphisms, or other rare genetic variants that interfere with analysis. Families should understand that rare diagnostic errors may occur for these reasons.

NORMAL PATTERN

There is a normal pattern of hemoglobins and normal levels of Hb A2 and Hb F are present. No variant hemoglobins are observed. This is consistent with A/A phenotype. If iron deficiency coexists with a mild/silent beta thalassemia trait Hb A2 may be in the normal range. Rare variant hemoglobins have no separation from hemoglobin A by capillary zone electrophoresis (CZE) or high-performance liquid chromatography (HPLC). If clinically indicated, Thalassemia and Hemoglobinopathy Comprehensive (TC 17365) should be considered.

Chromosome Analysis, Blood

Chromosome Analysis, Blood

No Historical Data

FINAL

Order ID:

Specimen Type: Blood

Clinical Indication: Donor screening

RESULT:
NORMAL MALE KARYOTYPE

INTERPRETATION:
Chromosome analysis revealed normal G-band patterns within the limits of standard cytogenetic analysis.

Please expect the results of any other concurrent study in a separate report.

NOMENCLATURE:
46,XY

ASSAY INFORMATION:
Method: G-Band (Digital Analysis:
MetaSystems/Ikaros)
Cells Counted: 20
Band Level: 550
Cells Analyzed: 5
Cells Karyotyped: 5

This test does not address genetic disorders that cannot be detected by standard cytogenetic methods or rare events such as low level mosaicism or subtle rearrangements.
A portion of the testing was performed at AMD18.

Christine A. Curtis, Ph.D., FACMG, Technical Director, Cytogenetics and Genomics, 703-802-7156, [site AMD10]
