

Donor 7288

Genetic Testing Summary

Fairfax Cryobank recommends reviewing this genetic testing summary with your healthcare provider to determine suitability.

Last Updated: 03/19/25

Donor Reported Ancestry: English, Norwegian

Jewish Ancestry: No

Genetic Test*	Result	Comments/Donor's Residual Risk**
Chromosome analysis (karyotype)	Normal male karyotype	No evidence of clinically significant chromosome abnormalities
Hemoglobin evaluation	Normal hemoglobin fractionation and MCV/MCH results	Reduced risk to be a carrier for sickle cell anemia, beta thalassemia, alpha thalassemia trait (aa/-- and a-/a-) and other hemoglobinopathies
Expanded Genetic Disease Carrier Screening Panel attached- 549 diseases by gene sequencing.	Carrier: Combined Malonic and Methylmalonic Aciduria (ACSF3) Carrier: Isovaleric Acidemia (IVD) Negative for other genes sequenced.	Partner testing is recommended before using this donor.

*No single test can screen for all genetic disorders. A negative screening result significantly reduces, but cannot eliminate, the risk for these conditions in a pregnancy.

**Donor residual risk is the chance the donor is still a carrier after testing negative.

Patient Information

Patient Name: Donor 7288

Date Of Birth: [REDACTED]

Gender: Male

Ethnicity: Northern European
Caucasian

Patient ID: N/A

Sample Type: Blood

**CARRIER SCREENING REPORT**

ABOUT THIS SCREEN: Horizon™ is a carrier screen for specific autosomal recessive and X-linked diseases. This information can help patients learn their risk of having a child with specific genetic conditions.

ORDER SELECTED: The Horizon Custom panel was ordered for this patient. Males are not screened for X-linked diseases

FINAL RESULTS SUMMARY:**CARRIER for Combined Malonic And Methylmalonic Aciduria**

Positive for the pathogenic variant c.1672C>T (p.R558W) in the ACSF3 gene. Please note that this ACSF3 variant has been reported with varying consequences. Some patients have presented with seizures, encephalopathy, and/or recurrent ketoacidosis (PMIDs: 21841779 and 26827111), while others have displayed a largely benign clinical course (PMID: 29858964). If this individual's partner is a carrier for COMBINED MALONIC AND METHYLMALONIC ACIDURIA, their chance to have a child with this condition is 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

CARRIER for Isovaleric Acidemia

Positive for the likely pathogenic variant c.618del (p.I206Mfs*40) in the IVD gene. If this individual's partner is a carrier for ISOVALERIC ACIDEMIA, their chance to have a child with this condition may be as high as 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

Negative for 547 out of 549 diseases

No other pathogenic variants were detected in the genes that were screened. The patient's remaining carrier risk after the negative screening results is listed for each disease/gene on the Horizon website at <https://www.natera.com/panel-option/h-all/>. Please see the following pages of this report for a comprehensive list of all conditions included on this individual's screen.

Carrier screening is not diagnostic and may not detect all possible pathogenic variants in a given gene.

RECOMMENDATIONS

Individuals who would like to review their Horizon report with a Natera Laboratory Genetic Counselor may schedule a telephone genetic information session by calling 650-249-9090 or visiting naterasession.com. Clinicians with questions may contact Natera at 650-249-9090 or email support@natera.com. Individuals with positive results may wish to discuss these results with family members to allow them the option to be screened. Comprehensive genetic counseling to discuss the implications of these test results and possible associated reproductive risk is recommended.

COMBINED MALONIC AND METHYLMALONIC ACIDURIA**Understanding Your Horizon Carrier Screen Results****What is Combined Malonic and Methylmalonic Aciduria?**

Combined Malonic and Methylmalonic Aciduria (CMAMMA) is an inherited disorder that causes high levels of malonic acid and methylmalonic acid in the body and urine. Signs and symptoms can begin in childhood or adulthood. In those with childhood-onset disease, symptoms may include organ damage due to acidosis, involuntary muscles tension, weak muscle tone, developmental delays, poor growth and weight gain, small head size, low blood sugar, or even coma. For those with delayed adult-onset disease, symptoms usually include seizures, memory loss, cognitive decline, or psychiatric disease. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

What causes Combined Malonic and Methylmalonic Aciduria?

CMAMMA is caused by a change, or mutation, in both copies of the ACSF3 gene pair. These mutations cause the ACSF3 genes to not work properly or not work at all. When both copies of this gene do not work correctly, it leads to the symptoms described above. CMAMMA is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the ACSF3 gene to have a child with CMAMMA. People who are carriers for CMAMMA are usually healthy and do not have symptoms nor do they have the disorder themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for CMAMMA there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their ACSF3 gene mutations to the child, who will then have CMAMMA. Individuals found to carry more than one mutation for CMAMMA should discuss their risk for having an affected child, and any potential risks to their own health, with their health care provider.

What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for CMAMMA ordered by a health care professional. If your partner is not found to be a carrier for CMAMMA, your risk of having a child with CMAMMA is greatly reduced. Couples at risk of having a baby with CMAMMA can opt to have prenatal diagnostic testing done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose have the baby tested after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for CMAMMA ordered by a health care professional. If your partner is found to be a carrier for CMAMMA, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnostic testing of the fetus or testing the baby after birth for CMAMMA
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for CMAMMA
- Adoption or use of a sperm or egg donor who is not a carrier for CMAMMA

What resources are available?

ISOVALERIC ACIDEMIA**Understanding Your Horizon Carrier Screen Results****What is Isovaleric Acidemia?**

Isovaleric Acidemia (IVA) is a type of inherited condition known as an organic acid disorder. People with IVA have problems breaking down an amino acid called leucine from the food they eat. This inability to breakdown proteins that contain leucine causes harmful substances to build up in their blood and urine. The severity of Isovaleric Acidemia ranges from mild to severe. In the severe form signs and symptoms can begin in the first days of life and include poor appetite, lethargy (extreme tiredness), vomiting, a "sweaty feet" smell, and seizures. Early death may occur if the condition is not treated. Children with a milder form of Isovaleric Acidemia may have failure to grow and gain weight at the typical rate and may have delayed development. Most people with Isovaleric Acidemia need lifelong dietary and medical treatment. However, some people with Isovaleric Acidemia may never have symptoms of this disorder. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

What causes Isovaleric Acidemia?

Isovaleric Acidemia is caused by a gene change, or mutation, in both copies of the IVD gene pair. These mutations cause the genes to not work properly or not work at all. The function of the IVD genes is to break down a particular building block of protein (amino acid) called leucine. When both copies of this gene do not work correctly it leads to a toxic buildup of organic acids in the blood causing the symptoms described above. Isovaleric Acidemia is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the IVD gene to have a child with Isovaleric Acidemia. People who are carriers for Isovaleric Acidemia are usually healthy and do not have symptoms nor do they have Isovaleric Acidemia themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Isovaleric Acidemia, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their IVD gene mutations to the child, who will then have Isovaleric Acidemia. Individuals found to carry more than one mutation for Isovaleric Acidemia should discuss any risks to their own health and their risk for having an affected child with their health care provider.

What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for Isovaleric Acidemia ordered by a health care professional. If your partner is not found to be a carrier for Isovaleric Acidemia, your risk of having a child with Isovaleric Acidemia is greatly reduced. Couples at risk of having a baby with Isovaleric Acidemia can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition. Although Isovaleric Acidemia is screened for as part of the newborn screening program in all states, babies at 25% risk for this condition may need diagnostic testing in addition to newborn screening. If you are not yet pregnant, your partner can have carrier screening for Isovaleric Acidemia ordered by a health care professional. If your partner is found to be a carrier for Isovaleric Acidemia, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnosis of the fetus or testing the baby after birth for Isovaleric Acidemia
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for Isovaleric Acidemia
- Adoption or use of a sperm or egg donor who is not a carrier for Isovaleric Acidemia

What resources are available?

- Isovaleric Acidemia: <http://www.babysfirsttest.org/newborn-screening/conditions/isovaleric-acidemia>
- Prenatal diagnosis done through CVS: <http://www.marchofdimes.org/chorionic-villus-sampling.aspx>
- Prenatal diagnosis done through Amniocentesis: <http://www.marchofdimes.org/amniocentesis.aspx>
- Preimplantation genetic diagnosis (PGD) with IVF: <http://www.natera.com/spectrum>

VARIANT DETAILS**ACSF3, c.1672C>T (p.R558W), pathogenic**

- The c.1672C>T (p.R558W) variant in the ACSF3 gene has been observed at a frequency of 0.2588% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with late-onset combined malonic and methylmalonic aciduria (PMID: 21841779, 26827111, 30740739).
- Patients showed abnormal metabolic profile diagnostic for combined malonic and methylmalonic aciduria (PMID: 21841779).
- This variant has been reported in ClinVar [ID: 31134].

IVD, c.618del (p.I206Mfs*40), likely pathogenic

- The c.618del (p.I206Mfs*40) variant in the IVD gene has been observed at a frequency of 0.0028% in the gnomAD v2.1.1 dataset.
- This premature termination variant is predicted to cause nonsense-mediated decay (NMD) in a gene where loss-of-function is a known mechanism of disease.
- This variant has been reported in ClinVar [ID: 459930].

DISEASES SCREENED

Below is a list of all diseases screened and the result. Certain conditions have unique patient-specific numerical values, therefore, results for those conditions are formatted differently.

Autosomal Recessive

1

17-BETA HYDROXYSTEROID DEHYDROGENASE 3 DEFICIENCY (*HSD17B3*) **negative**

3

3-BETA-HYDROXYSTEROID DEHYDROGENASE TYPE II DEFICIENCY (*HSD3B2*) **negative**

3-HYDROXY-3-METHYLGUTARYL-COENZYME A LYASE DEFICIENCY (*HMGCL*) **negative**

3-HYDROXYACYL-COA DEHYDROGENASE DEFICIENCY (*HADH*) **negative**

3-METHYLCROTONYL-CoA CARBOXYLASE 2 DEFICIENCY (*MCCC2*) **negative**

3-PHOSPHOGLYCERATE DEHYDROGENASE DEFICIENCY (*PHGDH*) **negative**

5

5-ALPHA-REDUCTASE DEFICIENCY (*SRD5A2*) **negative**

6

6-PYRUVYL-TETRAHYDROPTERIN SYNTHASE (*PTPS*) DEFICIENCY (*PTS*) **negative**

A

ABCA4-RELATED CONDITIONS (*ABCA4*) **negative**

ABETALIPOPROTEINEMIA (*MTTP*) **negative**

ACHONDROGENESIS, TYPE 1B (*SLC26A2*) **negative**

ACHROMATOPSIA, CNGB3-RELATED (*CNGB3*) **negative**

ACRODERMATITIS ENTEROPATHICA (*SLC39A4*) **negative**

ACTION MYOCLONUS-RENAL FAILURE (AMRF) SYNDROME (*SCARB2*) **negative**

ACUTE INFANTILE LIVER FAILURE, TRMU-RELATED (*TRMU*) **negative**

ACYL-COA OXIDASE I DEFICIENCY (*ACOX1*) **negative**

AICARDI-GOUTIERES SYNDROME (*SAMHD1*) **negative**

AICARDI-GOUTIERES SYNDROME, RNASEH2A-RELATED (*RNASEH2A*) **negative**

AICARDI-GOUTIERES SYNDROME, RNASEH2B-RELATED (*RNASEH2B*) **negative**

AICARDI-GOUTIERES SYNDROME, RNASEH2C-RELATED (*RNASEH2C*) **negative**

AICARDI-GOUTIERES SYNDROME, TREX1-RELATED (*TREX1*) **negative**

ALPHA-MANNOSIDOSIS (*MAN2B1*) **negative**

ALPHA-THALASSEMIA (*HBA1/HBA2*) **negative**

ALPORT SYNDROME, COL4A3-RELATED (*COL4A3*) **negative**

ALPORT SYNDROME, COL4A4-RELATED (*COL4A4*) **negative**

ALSTROM SYNDROME (*ALMS1*) **negative**

AMISH INFANTILE EPILEPSY SYNDROME (*ST3GAL5*) **negative**

ANDERMANN SYNDROME (*SLC12A6*) **negative**

ARGININE:GLYCINE AMIDINOTRANSFERASE DEFICIENCY (AGAT DEFICIENCY) (*GATM*) **negative**

ARGININEMIA (*ARG1*) **negative**

ARGININOSUCCINATE LYASE DEFICIENCY (*ASL*) **negative**

AROMATASE DEFICIENCY (*CYP19A1*) **negative**

ASPARAGINE SYNTHETASE DEFICIENCY (*ASNS*) **negative**

ASPARTYLGLYCOSAMINURIA (AGA) **negative**

ATAXIA WITH VITAMIN E DEFICIENCY (*TTPA*) **negative**

ATAXIA-TELANGECTASIA (*ATM*) **negative**

ATAXIA-TELANGECTASIA-LIKE DISORDER 1 (*MRE11*) **negative**

ATRAUSFERRINEMIA (*TF*) **negative**

AUTISM SPECTRUM, EPILEPSY AND ARTHROGRYPOSIS (*SLC35A3*) **negative**

AUTOIMMUNE POLYGLANDULAR SYNDROME, TYPE 1 (*AIRE*) **negative**

AUTOSOMAL RECESSIVE CONGENITAL ICHTHYOSIS (ARCI), SLC27A4-RELATED (*SLC27A4*) **negative**

AUTOSOMAL RECESSIVE SPASTIC ATAXIA OF CHARLEVOIX-SAGUENAY (SACS) **negative**

BIOTINIDASE DEFICIENCY (*BTD*) **negative**

BIOTIN-THIAMINE-RESPONSIVE BASAL GANGLIA DISEASE (BTBGD) (*SLC19A3*) **negative**

BLOOM SYNDROME (*BLM*) **negative**

BRITTLE CORNEA SYNDROME 1 (*ZNF469*) **negative**

BRITTLE CORNEA SYNDROME 2 (*PRDM5*) **negative**

C

CANAVAN DISEASE (*ASPA*) **negative**

CARBAMOYL PHOSPHATE SYNTHETASE I DEFICIENCY (*CPS1*) **negative**

CARNITINE DEFICIENCY (*SLC22A5*) **negative**

CARNITINE PALMITOYLTRANSFERASE IA DEFICIENCY (*CPT1A*) **negative**

CARNITINE PALMITOYLTRANSFERASE II DEFICIENCY (*CPT2*) **negative**

CARNITINE-ACYLCARNITINE TRANSLOCASE DEFICIENCY (*SLC25A20*) **negative**

CARPENTER SYNDROME (*RAB23*) **negative**

CARTILAGE-HAIR HYPOPLASIA (*RMRP*) **negative**

CATECHOLAMINERGIC POLYMORPHIC VENTRICULAR TACHYCARDIA (*CASQ2*) **negative**

CD59-MEDIATED HEMOLYTIC ANEMIA (*CD59*) **negative**

CEP152-RELATED MICROCEPHALY (*CEP152*) **negative**

CEREBRAL DYSGENESIS, NEUROPATHY, ICHTHYOSIS, AND PALMOPLANTAR

KERATODERMA (CEDNIK) SYNDROME (*SNAP29*) **negative**

CEREBROTENDINOUS XANTHOMATOSIS (*CYP27A1*) **negative**

CHARCOT-MARIE-TOOTH DISEASE, RECESSIVE INTERMEDIATE C (*PLEKHG5*) **negative**

CHARCOT-MARIE-TOOTH-DISEASE, TYPE 4D (*NDRG1*) **negative**

CHEDIAK-HIGASHI SYNDROME (*LYST*) **negative**

CHOREOACANTHOCYTOSIS (*VPS13A*) **negative**

CHRONIC GRANULOMATOUS DISEASE, CYBA-RELATED (*CYBA*) **negative**

CHRONIC GRANULOMATOUS DISEASE, NCF2-RELATED (*NCF2*) **negative**

CILIOPATHIES, RPGRIP1L-RELATED (*RPGRIP1L*) **negative**

CITRIN DEFICIENCY (*SLC25A13*) **negative**

CITRULLINEMIA, TYPE 1 (*ASS1*) **negative**

CLN10 DISEASE (*CTSD*) **negative**

COHEN SYNDROME (*VPS13B*) **negative**

COL11A2-RELATED CONDITIONS (*COL11A2*) **negative**

COMBINED MALONIC AND METHYLMALONIC ACIDURIA (*ACSF3*) **see first page**

COMBINED OXIDATIVE PHOSPHORYLATION DEFICIENCY 1 (*GFM1*) **negative**

COMBINED OXIDATIVE PHOSPHORYLATION DEFICIENCY 3 (*TSFM*) **negative**

COMBINED PITUITARY HORMONE DEFICIENCY 1 (*POU1F1*) **negative**

COMBINED PITUITARY HORMONE DEFICIENCY-2 (*PROP1*) **negative**

CONGENITAL ADRENAL HYPERPLASIA, 11-BETA-HYDROXYLASE DEFICIENCY

(*CYP11B1*) **negative**

CONGENITAL ADRENAL HYPERPLASIA, 17-ALPHA-HYDROXYLASE DEFICIENCY

(*CYP17A1*) **negative**

CONGENITAL ADRENAL HYPERPLASIA, 21-HYDROXYLASE DEFICIENCY

(*CYP21A2*) **negative**

CONGENITAL ADRENAL INSUFFICIENCY, CYP11A1-RELATED (*CYP11A1*) **negative**

CONGENITAL AMEGAKARYOCYTIC THROMBOCYTOPENIA (*MPL*) **negative**

CONGENITAL CHRONIC DIARRHEA (*DGAT1*) **negative**

CONGENITAL DISORDER OF GLYCOSYLATION TYPE 1, ALG1-RELATED (*ALG1*) **negative**

CONGENITAL DISORDER OF GLYCOSYLATION, TYPE 1A, PMM2-Related (*PMM2*) **negative**

CONGENITAL DISORDER OF GLYCOSYLATION, TYPE 1B (*MPL*) **negative**

CONGENITAL DISORDER OF GLYCOSYLATION, TYPE 1C (*ALG6*) **negative**

CONGENITAL DYSERYTHROPOIETIC ANEMIA TYPE 2 (*SEC23B*) **negative**

CONGENITAL FINNISH NEPHROSIS (*NPHS1*) **negative**

CONGENITAL HYDROCEPHALUS 1 (*CCDC88C*) **negative**

CONGENITAL HYPERINSULINISM, KCNJ11-Related (*KCNJ11*) **negative**

CONGENITAL INSENSITIVITY TO PAIN WITH ANHIDROSIS (CIPA) (*NTRK1*) **negative**

CONGENITAL MYASTHENIC SYNDROME, CHAT-RELATED (*CHAT*) **negative**

CONGENITAL MYASTHENIC SYNDROME, CHRNE-RELATED (*CHRNE*) **negative**

Testing Methodology, Limitations, and Comments:**Next-generation sequencing (NGS)**

Sequencing library prepared from genomic DNA isolated from a patient sample is enriched for targets of interest using standard hybridization capture protocols and PCR amplification (for targets specified below). NGS is then performed to achieve the standards of quality control metrics, including a minimum coverage of 99% of targeted regions at 20X sequencing depth. Sequencing data is aligned to human reference sequence, followed by deduplication, metric collection and variant calling (coding region +/- 20bp). Variants are then classified according to ACMGG/AMP standards of interpretation using publicly available databases including but not limited to ENSEMBL, HGMD Pro, ClinGen, ClinVar, 1000G, ESP and gnomAD. Variants predicted to be pathogenic or likely pathogenic for the specified diseases are reported. It should be noted that the data interpretation is based on our current understanding of the genes and variants at the time of reporting. Putative positive sequencing variants that do not meet internal quality standards or are within highly homologous regions are confirmed by Sanger sequencing or gene-specific long-range PCR as needed prior to reporting.

Copy Number Variant (CNV) analysis is limited to deletions involving two or more exons for all genes on the panel, in addition to specific known recurrent single-exon deletions. CNVs of small size may have reduced detection rate. This method does not detect gene inversions, single-exonic and sub-exonic deletions (unless otherwise specified), and duplications of all sizes (unless otherwise specified). Additionally, this method does not define the exact breakpoints of detected CNV events. Confirmation testing for copy number variation is performed by specific PCR, Multiplex Ligation-dependent Probe Amplification (MLPA), next generation sequencing, or other methodology.

This test may not detect certain variants due to local sequence characteristics, high/low genomic complexity, homologous sequence, or allele dropout (PCR-based assays). Variants within noncoding regions (promoter, 5'UTR, 3'UTR, deep intronic regions, unless otherwise specified), small deletions or insertions larger than 25bp, low-level mosaic variants, structural variants such as inversions, and/or balanced translocations may not be detected with this technology.

SPECIAL NOTES

For ABCC6, variants in exons 1-9 are not detected due to the presence of regions of high homology.

For CFTR, when the CFTR R117H variant is detected, reflex analysis of the polythymidine variations (5T, 7T and 9T) at the intron 9 branch/acceptor site of the CFTR gene will be performed.

For CYP21A2, targets were enriched using long-range PCR amplification, followed by next generation sequencing. Duplication analysis will only be performed and reported when c.955C>T (p.Q319*) is detected. Sequencing and CNV analysis may have reduced sensitivity, if variants result from complex rearrangements, in trans with a gene deletion, or CYP21A2 gene duplication on one chromosome and deletion on the other chromosome. This analysis cannot detect sequencing variants located on the CYP21A2 duplicated copy.

For DDX11, only NM_030653.3:c.1763 - 1G > C variant will be analyzed and reported.

For GJB2, CNV analysis of upstream deletions of GJB6-D13S1830 (309kb deletion) and GJB6-D13S1854 (232kb deletion) is included.

For HBA1/HBA2, CNV analysis is offered to detect common deletions of -alpha3.7, -alpha4.2, --MED, --SEA, --FIL, --THAI, --alpha20.5, and/or HS-40.

For OTOA, variants in exons 20 - 28 are not analyzed due to high sequence homology.

For RPGRIP1L, variants in exon 23 are not detected due to assay limitation.

For SAMD9, only p.K1495E variant will be analyzed and reported.

Friedreich Ataxia (FXN)

The GAA repeat region of the FXN gene is assessed by trinucleotide PCR assay and capillary electrophoresis. Variances of +/-1 repeat for normal alleles and up to +/-3 repeats for premutation alleles may occur. For fully penetrant expanded alleles, the precise repeat size cannot be determined, therefore the approximate allele size is reported. Sequencing and copy number variants are analyzed by next-generation sequencing analysis.

Friedreich Ataxia Repeat Categories

Categories	GAA Repeat Sizes
Normal	<34
Premutation	34 - 65
Full	>65

Spinal Muscular Atrophy (SMN1)

The total combined copy number of SMN1 and SMN2 exon 7 is quantified based on NGS read depth. The ratio of SMN1 to SMN2 is calculated based on the read depth of a single nucleotide that distinguishes these two genes in exon 7. In addition to copy number analysis, testing for the presence or absence of a single nucleotide polymorphism (g.27134T>G in intron 7 of SMN1) associated with the presence of a SMN1 duplication allele is performed using NGS.

Ethnicity	Two SMN1 copies carrier risk before g.27134T>G testing	Carrier risk after g.27134T>G testing	
		g.27134T>G ABSENT	g.27134T>G PRESENT
Caucasian	1 in 632	1 in 769	1 in 29
Ashkenazi Jewish	1 in 350	1 in 580	LIKELY CARRIER
Asian	1 in 628	1 in 702	LIKELY CARRIER
African-American	1 in 121	1 in 396	1 in 34
Hispanic	1 in 1061	1 in 1762	1 in 140

Variant Classification

Only pathogenic or likely pathogenic variants are reported. Other variants including benign variants, likely benign variants, variants of uncertain significance, or inconclusive variants identified during this analysis may be reported in certain circumstances. Our laboratory's variant classification criteria are based on the ACMG and internal guidelines and our current understanding of the specific genes. This interpretation may change over time as more information about a gene and/or variant becomes available. Natera and its lab partner(s) may reclassify variants at certain intervals but may not release updated reports without a specific request made to Natera by the ordering provider. Natera may disclose incidental findings if deemed clinically pertinent to the test performed.

Negative Results

A negative carrier screening result reduces the risk for a patient to be a carrier of a specific disease but does not completely rule out carrier status. Please visit <https://www.natera.com/panel-option/h-all/> for a table of carrier rates, detection rates, residual risks and promised variants/exons per gene. Carrier rates before and after testing vary by ethnicity and assume a negative family history for each disease screened and the absence of clinical symptoms in the patient. Any patient with a family history for a specific genetic disease will have a higher carrier risk prior to testing and, if the disease-causing mutation in their family is not included on the test, their carrier risk would remain unchanged. Genetic counseling is recommended for patients with a family history of genetic disease so that risk figures based on actual family history can be determined and discussed along with potential implications for reproduction. Horizon carrier screening has been developed to identify the reproductive risks for monogenic inherited conditions. Even when one or both members of a couple screen negative for pathogenic variants in a specific gene, the disease risk for their offspring is not zero. There is still a low risk for the condition in their offspring due to a number of different mechanisms that are not detected by Horizon including, but not limited to, pathogenic variant(s) in the tested gene or in a different gene not included on Horizon, pathogenic variant(s) in an upstream regulator, uniparental disomy, de novo mutation(s), or digenic or polygenic inheritance.

Additional Comments

These analyses generally provide highly accurate information regarding the patient's carrier status. Despite this high level of accuracy, it should be kept in mind that there are many potential sources of diagnostic error, including misidentification of samples, polymorphisms, or other rare genetic variants that interfere with analysis. Families should understand that rare diagnostic errors may occur for these reasons.
