

## **Donor 7137**

# **Genetic Testing Summary**

Fairfax Cryobank recommends reviewing this genetic testing summary with your healthcare provider to determine suitability.

Last Updated: 09/30/24

Donor Reported Ancestry: Italian, German, Salvadoran Jewish Ancestry: No

Genetic Test*	Result	Comments/Donor's Residual Risk**
Chromosome analysis (karyotype)	Normal male karyotype	No evidence of clinically significant chromosome abnormalities
Hemoglobin evaluation	Normal hemoglobin fractionation and MCV/MCH results	Reduced risk to be a carrier for sickle cell anemia, beta thalassemia, alpha thalassemia trait (aa/ and a-/a-) and other hemoglobinopathies
Expanded Genetic Disease Carrier Screening Panel attached- 549 diseases by gene sequencing.	POSSIBLE CARRIER for Congenital Adrenal Hyperplasia, 21-Hydroxylase Deficiency (CYP21A2)  CARRIER for Congenital Nephrotic Syndrome, PLCE1-Related  CARRIER for Mucopolysaccharidosis, Type Iii A ( Sanfilippo A ) (SGSH)  CARRIER for Non-Syndromic Hearing Loss, GJB2-Related  CARRIER for Usher Syndrome, Type 2A (USH2A)  Negative for other genes sequenced.	Partner testing is recommended before using this donor.

<sup>\*</sup>No single test can screen for all genetic disorders. A negative screening result significantly reduces, but cannot eliminate, the risk for these conditions in a pregnancy.

<sup>\*\*</sup>Donor residual risk is the chance the donor is still a carrier after testing negative.

## **CARRIER SCREENING REPORT**

ABOUT THIS SCREEN: Horizon™ is a carrier screen for specific autosomal recessive and X-linked diseases. This information can help patients learn their risk of having a child with specific genetic conditions.

**ORDER SELECTED:** The Horizon Custom panel was ordered for this patient. Males are not

screened for X-linked diseases

## **FINAL RESULTS SUMMARY:**

## POSSIBLE CARRIER for Congenital Adrenal Hyperplasia, 21-Hydroxylase Deficiency

Positive for the pathogenic variant c.955C>T (p.Q319\*) in the CYP21A2 gene. Reflex testing detected a duplication of the CYP21A2 gene. This analysis cannot determine if the CYP21A2 c.955C>T (p.Q319\*) variant and CYP21A2 duplication are on the same (in cis) or opposite (in trans) chromosomes in this individual. The p.Q319\* pathogenic variant and the CYP21A2 duplication are often found in the same copy (cis configuration) of the CYP21A2 gene, and the cis allele has been previously reported to be associated with normal gene function (PMIDs: 15858147 and 23269230). If they are in trans, then the patient would be a carrier for this condition. Parental analysis may be considered in order to determine the chromosomal configuration of the p.Q319\* pathogenic variant and the CYP21A2 duplication. Clinical correlation and genetic counseling are recommended. If this individual's partner is a carrier for CONGENITAL ADRENAL HYPERPLASIA, 21-HYDROXYLASE DEFICIENCY, their chance to have a child with this condition may be as high as 1 in 4 (25%). Carrier screening for this individual's partner is recommended.

#### **CARRIER for Congenital Nephrotic Syndrome, PLCE1-Related**

Positive for the likely pathogenic variant c.1809+1G>T in the PLCE1 gene. If this individual's partner is a carrier for CONGENITAL NEPHROTIC SYNDROME, PLCE1-RELATED, their chance to have a child with this condition may be as high as 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

## CARRIER for Mucopolysaccharidosis, Type III A (Sanfilippo A)

Positive for the pathogenic variant c.617G>C (p.R206P) in the SGSH gene. If this individual's partner is a carrier for MUCOPOLYSACCHARIDOSIS, TYPE III A (SANFILIPPO A), their chance to have a child with this condition is 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

## **CARRIER for Non-Syndromic Hearing Loss, GJB2-Related**

Positive for the pathogenic variant c.35del (p.G12Vfs\*2) in the GJB2 gene. Although most variants in this gene are associated with an autosomal recessive form of NON-SYNDROMIC HEARING LOSS, GJB2-RELATED, some rare GJB2 variants may cause an autosomal dominant form of the condition. To our knowledge, there is insufficient evidence that this variant causes an autosomal dominant form of this condition. If this individual's partner is a carrier for NON-SYNDROMIC HEARING LOSS, GJB2-RELATED, their chance to have a child with this condition is likely 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

#### **CARRIER for Usher Syndrome, Type 2A**

Positive for the pathogenic variant c.2276G>T (p.C759F) in the USH2A gene. If this individual's partner is a carrier for USHER SYNDROME, TYPE 2A, their chance to have a child with this condition is 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

#### Negative for 544 out of 549 diseases

No other pathogenic variants were detected in the genes that were screened. The patient's remaining carrier risk after the negative screening results is listed for each disease/gene on the Horizon website at <a href="https://www.natera.com/panel-option/h-all/">https://www.natera.com/panel-option/h-all/</a>. Please see the following pages of this report for a comprehensive list of all conditions included on this individual's screen.

Carrier screening is not diagnostic and may not detect all possible pathogenic variants in a given gene.

#### RECOMMENDATIONS

Individuals who would like to review their Horizon report with a Natera Laboratory Genetic Counselor may schedule a telephone genetic information session by calling 650-249-9090 or visiting naterasession.com. Clinicians with questions may contact Natera at 650-249-9090 or email support@natera.com. Individuals with positive results may wish to discuss these results with family members to allow them the option to be screened. Comprehensive genetic counseling to discuss the implications of these test results and possible associated reproductive risk is recommended.

## CONGENITAL ADRENAL HYPERPLASIA, 21-HYDROXYLASE DEFICIENCY

#### **Understanding Your Horizon Carrier Screen Results**

## What is Congenital Adrenal Hyperplasia, 21-Hydroxylase Deficiency?

Congenital Adrenal Hyperplasia, 21-Hydroxylase Deficiency (also called 21-Hydroxylase Deficiency) is an inherited disorder that causes the adrenal glands, the organs that sit on top of the kidneys, to make decreased amounts of the hormones cortisol and aldosterone and increased amounts of male sex hormones called androgens.

There are three forms of 21-Hydroxylase Deficiency. The most common and severe form is called the 'salt-wasting type' with signs and symptoms that are often present at birth. Babies with the salt-wasting type of 21-Hydroxylase Deficiency are at risk for losing large amounts of sodium in the urine due to too low a level of aldosterone hormone. These 'salt-wasting crises' can lead to poor feeding, weight loss, dehydration, vomiting, low blood pressure, and shock, and can be life-threatening if not treated quickly. Symptoms in females include being born with external genitals that do not have the typical appearance of male or female (ambiguous genitalia). Over time, affected females may also have early puberty, rapid early growth with short adult height, increased body hair (hirsutism), male pattern baldness, irregular menstrual periods, and decreased fertility. Affected males have normal genitals at birth but are at risk for salt-wasting crises and may have increased penis size and decreased testicle size over time as well as an early growth spurt with short adult height. Some males with this form have decreased fertility due to benign growths in their testicles called 'testicular adrenal rest tumors' (TART).

The 'simple virilizing type' of 21-Hydroxylase Deficiency has similar symptoms to the salt-wasting type except babies with the simple virilizing type are not at risk for salt wasting crises.

The mildest form of 21-Hydroxylase Deficiency is called the 'non-classical type'. People with the nonclassical type of 21-Hydroxylase Deficiency have normal external genitals. Signs and symptoms may begin as early as childhood or not until adulthood and may include an early growth spurt with short adult height, early puberty, and acne. Additional symptoms in females may include excess body hair, male pattern baldness, irregular periods, and decreased fertility. Additional symptoms in males may include early and heavy facial hair and small testicles. Some people with this type never develop symptoms.

Currently, there is no cure for 21-Hydroxylase Deficiency. However, hormone replacement therapy can prevent or lessen some or all of the symptoms. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

## What causes Congenital Adrenal Hyperplasia, 21-Hydroxylase Deficiency?

21-Hydroxylase Deficiency is caused by a change, or mutation, in both copies of the CYP21A2 gene pair. These mutations cause the genes to not work properly or not work at all. The function of the CYP21A2 genes is to help make sex hormones and other hormones. When both copies of this gene do not work correctly, it leads to the symptoms described above.

21-Hydroxylase Deficiency is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the CYP21A2 gene to have a child with 21-Hydroxylase Deficiency. People who are carriers for 21-Hydroxylase Deficiency are usually healthy and do not have symptoms nor do they have the disorder themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for 21-Hydroxylase Deficiency, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their CYP21A2 gene mutations to the child, who will then have this condition. It is sometimes, but not always, possible to determine whether a specific mutation in the CYP21A2 gene will cause the salt-wasting type, the simple virilizing type, or the non-classic type of 21-Hydroxylase Deficiency.

Individuals found to carry more than one mutation for 21-Hydroxylase Deficiency should discuss their risk for having an affected child, and any potential effects to their own health, with their health care provider.

There are a number of other forms of Congenital Adrenal Hyperplasia, each caused by mutations in different genes. A person who is a carrier for Congenital Adrenal Hyperplasia, 21-Hydroxylase Deficiency is not likely to be at increased risk for having a child with these other forms.

## What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org).

Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves.

If you are pregnant, your partner can have carrier screening for 21-Hydroxylase Deficiency ordered by a health care professional. If your partner is not found to be a carrier for 21-Hydroxylase Deficiency, your risk of having an affected child is greatly reduced. Couples at risk of having a baby with 21-Hydroxylase Deficiency can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for 21-Hydroxylase Deficiency ordered by a health care professional. If your partner is found to be a carrier for 21-Hydroxylase Deficiency, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnostic testing of the fetus or testing the baby after birth for 21-Hydroxylase Deficiency
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for 21Hydroxylase Deficiency
- Adoption or use of a sperm or egg donor who is not a carrier for 21-Hydroxylase Deficiency

- Genetics Home Reference: http://ghr.nlm.nih.gov/condition/21-hydroxylase-deficiency

## CONGENITAL NEPHROTIC SYNDROME, PLCE1-RELATED

#### **Understanding Your Horizon Carrier Screen Results**

#### What is Congenital Nephrotic Syndrome, PLCE1-Related?

Congenital Nephrotic Syndrome, PLCE1-Related (also known as Nephrotic Syndrome, Type3) is an inherited disorder that causes abnormal kidney function. Symptoms usually start shortly after birth or in infancy. Babies with this condition have large amounts of protein in their urine, low amounts of albumin (a protein in the plasma of the blood) and high levels of fat in the blood, and excess fluid in body tissues (edema). Anemia, poor blood clotting, and increased numbers of infections may occur in some babies. The kidney problems worsen over time, often leading to kidney failure in early childhood; although with careful treatment, kidney failure may not occur until the teenage years or early adulthood. Once kidney failure occurs, dialysis and then kidney transplantation are needed. Currently there is no cure for this condition and treatment is based on symptoms. Clinical trials involving potential new treatments for this condition may be available (see <a href="https://www.clinicaltrials.gov">www.clinicaltrials.gov</a>).

#### What causes Congenital Nephrotic Syndrome, PLCE1-Related?

Congenital Nephrotic Syndrome, PLCE1-Related is caused by a gene change, or mutation, in both copies of the PLCE1 gene pair. These mutations cause the genes to not work properly or not work at all. When both copies of this gene do not work correctly, it leads to the symptoms described above. Congenital Nephrotic Syndrome, PLCE1-Related is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the PLCE1 gene to have a child with Congenital Nephrotic Syndrome, PLCE1-Related. People who are carriers for Congenital Nephrotic Syndrome, PLCE1-Related are usually healthy and do not have symptoms nor do they have Congenital Nephrotic Syndrome, PLCE1-Related themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Congenital Nephrotic Syndrome, PLCE1-Related, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their PLCE1 gene mutations to the child, who would then have this condition. Individuals found to carry more than one mutation for Congenital Nephrotic Syndrome, PLCE1-Related should discuss any potential effects to their own health and their risk for having an affected child with their health care provider. There are other forms of Congenital Nephrotic Syndrome, each caused by mutations in different genes. A person who is a carrier of a mutation in the PLCE1 gene is unlikely to be at increased risk of having a child with these other forms.

#### What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (<a href="www.nsgc.org">www.nsgc.org</a>). ## MUCOPOLYSACCHARIDOSIS, TYPE III A (SANFILIPPO A)

#### **Understanding Your Horizon Carrier Screen Results**

## What is Mucopolysaccharidosis, Type IIIA (Sanfilippo A)?

Mucopolysaccharidosis (MPS), Type IIIA (also called Sanfilippo A) is an inherited disorder that affects many parts of the body. Signs and symptoms of MPS, Type IIIA usually begin in early childhood and include unusual facial features, a large head size, bone and joint abnormalities, intellectual disability, behavioral problems, sleep difficulties, and coordination and movement problems. Other symptoms include recurrent respiratory and ear infections, vision problems, hearing loss, and hernias. Children lose developmental skills over time, symptoms worsen, and lifespan is shortened with death usually occurring by early adulthood. In some cases, affected individuals have been treated with or participated in clinical trials using stem cell transplantation from cord blood or bone marrow. Couples at risk of having an affected child may consider cord blood banking, as siblings have a higher chance of being a match for stem cell transplantation than a non-related individual. More information can be found at: https://parentsguidecordblood.org/en. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

## What causes Mucopolysaccharidosis, Type IIIA (Sanfilippo A)?

MPS, Type IIIA is caused by a change, or mutation, in both copies of the SGSH gene pair. These mutations cause the genes to not work properly or not work at all. When both copies of the SGSH gene do not work correctly, it leads to the symptoms described above. MPS, Type IIIA is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the SGSH gene to have a child with MPS, Type IIIA. People who are carriers for MPS, Type IIIA are usually healthy and do not have symptoms nor do they have MPS, Type IIIA themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for MPS, Type IIIA there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their SGSH gene mutations to the child, who will then have this condition. Individuals found to carry more than one mutation for MPS, Type III should discuss their risk for having an affected child with their health care provider. There are many other types of Mucopolysaccharidosis, each caused by mutations in different genes. A carrier for MPS, Type IIIA is not likely to be at increased risk for having children with the other forms of MPS.

#### What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for MPS, Type IIIA ordered by a health care professional. If your partner is not found to be a carrier for MPS, Type IIIA, your risk of having a child with this condition is greatly reduced. Couples at risk of having a baby with MPS, Type IIIA can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for MPS, Type IIIA ordered by a health care professional. If your partner is found to be a carrier for MPS, Type IIIA, you have several reproductive ontions to consider:

- Natural pregnancy with or without prenatal diagnosis of the fetus or testing the baby after birth for MPS, Type IIIA
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for MPS, Type IIIA
- Adoption or use of a sperm or egg donor who is not a carrier for MPS, Type IIIA

## NON-SYNDROMIC HEARING LOSS, GJB2-RELATED

#### **Understanding Your Horizon Carrier Screen Results**

#### What is Non-Syndromic Hearing Loss, GJB2-Related?

Non-Syndromic Hearing Loss, GJB2-Related (also called DFNB1) is an inherited disorder that causes early-onset hearing loss. "Non-syndromic" means that no other parts of the body are affected, making hearing loss the only symptom of this condition. In Non-Syndromic Hearing Loss, GJB2-Related, hearing loss is typically present at birth (congenital). However, some children have normal hearing at birth and develop hearing loss during childhood. The severity varies from mild to profound sensorineural hearing loss. The treatment for hearing loss includes hearing aids and, in some cases, cochlear implants. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov). Non-Syndromic Hearing Loss, GJB2-Related does not cause other health problems.

## What causes Non-Syndromic Hearing Loss, GJB2-Related?

Non-Syndromic Hearing Loss, GJB2-Related is caused by a gene change, or mutation, in both copies of the GJB2 gene pair (also known as DFNB1). These mutations cause the genes to not work properly or not work at all. The function of the GJB2 genes is to make a protein that is important for hearing. When both copies of the GJB2 gene do not work correctly, it leads to Non-Syndromic Hearing Loss, GJB2-Related. Non-Syndromic Hearing Loss, GJB2-Related is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the GJB2 gene to have a child with Non-Syndromic Hearing Loss, GJB2-Related. People who are carriers for Non-Syndromic Hearing Loss, GJB2-Related are usually healthy and usually do not have Non-Syndromic Hearing Loss themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Non-Syndromic Hearing Loss, GJB2-Related, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their GJB2 gene mutations to the child, who will then have Non-Syndromic Hearing Loss, GJB2-Related. Very rarely, carriers of a single GJB2 mutation will have inherited hearing loss with or without other symptoms. These individuals usually have one parent who is also affected. This type of inheritance, where having only one mutation causes symptoms, is called autosomal dominant. When a person with autosomal dominant hearing loss has a child, there is a 50%, or 1 in 2, chance with each pregnancy of having a child who will also develop this type of hearing loss. It is sometimes, but not always, possible to determine whether a specific mutation in the GJB2 gene will cause autosomal recessive Non-Syndromic Hearing Loss or an autosomal dominant type of hearing loss. Individuals found to carry more than one mutation for Non-Syndromic Hearing Loss, GJB2-Related should discuss their risk for having an affected child and any potential effects to the

#### What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org). You may wish to share your carrier screening results with your health care providers, especially if you have a family history of hearing loss or have concerns about your own hearing. Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for Non-Syndromic Hearing Loss, GJB2-Related ordered by a health care professional. If your partner is not found to be a carrier for Non-Syndromic Hearing Loss, GJB2-Related, your risk of having a baby with Non-Syndromic Hearing Loss, GJB2-Related can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to test the baby after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for Non-Syndromic Hearing Loss, GJB2-Related ordered by a health care professional. ## **USHER SYNDROME, TYPE 2A**

#### **Understanding Your Horizon Carrier Screen Results**

## What is Usher Syndrome, Type 2A?

Usher Syndrome, Type 2A is one of a group of inherited disorders that cause hearing and vision loss that worsens over time. In most cases of Usher Syndrome, Type 2A, moderate to severe hearing loss is present at birth and affects higher frequencies more than lower. Speech involves lower frequencies, so speech and understanding language is often possible for children with this condition, although hearing aids and speech therapy are often needed. Retinitis Pigmentosa (RP) is an eye condition that occurs in people with Usher Syndrome, Type 2A and leads to damage to the retina, causing progressive loss of eyesight. RP and vision loss usually starts in the teenage years. Usher Syndrome, Type 2A does not affect intelligence or life span. Some people with Usher Syndrome, Type 2A have Retinitis Pigmentosa only and do not have hearing loss. Currently there is no cure for this condition and treatment is based on symptoms. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

## What causes Usher Syndrome, Type 2A?

Usher Syndrome, Type 2A is caused by a gene change, or mutation, in both copies of the USH2A gene pair. These mutations cause the genes to not work properly or not work at all. When both copies of this gene do not work correctly, it leads to the symptoms described above. Usher Syndrome, Type 2A is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the USH2A gene to have a child with Usher Syndrome, Type 2A. People who are carriers for Usher Syndrome, Type 2A are usually healthy and do not have symptoms nor do they have Usher Syndrome themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Usher Syndrome, Type 2A, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their USH2A gene mutations to the child, who will then have this condition. Individuals found to carry more than one mutation for Usher Syndrome, Type 2A should discuss their risk for having an affected child, and any potential effects to their own health, with their health care provider.

#### What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for Usher Syndrome, Type 2A ordered by a health care professional. If your partner is not found to be a carrier for Usher Syndrome, Type 2A, your risk of having a child with Usher Syndrome, Type 2A is greatly reduced. Couples at risk of having a baby with Usher Syndrome, Type 2A can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for Usher Syndrome, Type 2A ordered by a health care professional. If your partner is found to be a carrier for Usher Syndrome, Type 2A, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnosis of the fetus or testing the baby after birth for Usher Syndrome, Type 2A
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test the embryos for Usher Syndrome, Type 2A
- Adoption or use of a sperm or egg donor who is not a carrier for Usher Syndrome, Type 2A

#### VARIANT DETAILS

Case File ID:

## CYP21A2, c.955C>T (p.Q319\*), heterozygous, pathogenic

- The c.955C>T (p.Q319\*) variant in the CYP21A2 gene has been observed at a frequency of 0.0360% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with congenital adrenal hyperplasia, 21-hydroxylase deficiency (PMID: 3267225, 23359698).
- This premature termination variant is predicted to cause nonsense-mediated decay (NMD) in a gene where loss-of-function is a known mechanism of disease.
- This variant has been reported in ClinVar [ID: 12169].

## GJB2, c.35del (p.G12Vfs\*2), heterozygous, pathogenic

- The c.35del (p.G12Vfs\*2) variant in the GJB2 gene has been observed at a frequency of 0.6188% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with nonsyndromic hearing loss and deafness (DFNB) 1 (PMID: 9285800, 9328482, 9819448, 10422812, 10508996, 10713883).
- This premature termination variant is predicted to cause nonsense-mediated decay (NMD) in a gene where loss-of-function is a known mechanism of disease.
- This variant has been reported in ClinVar [ID: 17004].

## PLCE1, c.1809+1G>T, heterozygous, likely pathogenic

- The c.1809+1G>T variant in the PLCE1 gene has not been observed in the gnomAD v2.1.1 dataset.
- This canonical splicing variant is predicted to alter the reading frame and cause nonsense-mediated decay (NMD) in a gene where loss-of-function is a known mechanism of disease.
- This variant has not been described in ClinVar.

## SGSH, c.617G>C (p.R206P), heterozygous, pathogenic

- The c.617G>C (p.R206P) variant in the SGSH gene has not been observed in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with mucopolysaccharidosis, type IIIA (Sanfilippo syndrome A) (PMID: 9744479, 15637719, 24314109).
- Functional studies demonstrated that this variant causes reduced enzyme activity (PMID: 15542396, 24816101, 30809705, 15637719).
- This variant has been reported in ClinVar [ID: 5118].

## USH2A, c.2276G>T (p.C759F), heterozygous, pathogenic

- The c.2276G>T (p.C759F) variant in the USH2A gene has been observed at a frequency of 0.0968% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with Usher syndrome, type 2A (PMID: 16098008, 24944099, 29912909).
- This variant has been reported in ClinVar [ID: 2356].

#### **DISEASES SCREENED**

Below is a list of all diseases screened and the result. Certain conditions have unique patient-specific numerical values, therefore, results for those conditions are formatted differently.

#### **Autosomal Recessive**

17-BETA HYDROXYSTEROID DEHYDROGENASE 3 DEFICIENCY (HSD17B3) negative

3-BETA-HYDROXYSTEROID DEHYDROGENASE TYPE II DEFICIENCY (HSD3B2) negative 3-HYDROXY-3-METHYLGLUTARYL-COENZYME A LYASE DEFICIENCY (HMGCL) negative 3-HYDROXYACYL-COA DEHYDROGENASE DEFICIENCY (HADH) negative 3-METHYLCROTONYL-CoA CARBOXYLASE 2 DEFICIENCY (MCCC2) negative 3-PHOSPHOGLYCERATE DEHYDROGENASE DEFICIENCY (PHGDH) negative

5-ALPHA-REDUCTASE DEFICIENCY (SRD5A2) negative

6-PYRUVOYL-TETRAHYDROPTERIN SYNTHASE ( PTPS ) DEFICIENCY (PTS) negative

ABCA4-RELATED CONDITIONS (ABCA4) negative ABETALIPOPROTEINEMIA (MTTP) negative ACHONDROGENESIS, TYPE 1B (SLC26A2) negative ACHROMATOPSIA, CNGB3-RELATED (CNGB3) negative ACRODERMATITIS ENTEROPATHICA (SLC39A4) negative ACTION MYOCLONUS-RENAL FAILURE (AMRF) SYNDROME (SCARB2) negative

ACUTE INFANTILE LIVER FAILURE, TRMU-RELATED (TRMU) negative ACYL-COA OXIDASE I DEFICIENCY (ACOX1) negative AICARDI-GOUTIÈRES SYNDROME (SAMHD1) negative

AICARDI-GOUTIERES SYNDROME, RNASEH2A-RELATED (RNASEH2A) negative AICARDI-GOUTIERES SYNDROME, RNASEH2B-RELATED (RNASEH2B) negative AICARDI-GOUTIERES SYNDROME, RNASEH2C-RELATED (RNASEH2C) negative

AICARDI-GOUTIÈRES SYNDROME, TREX1-RELATED (TREX1) negative

ALPHA-MANNOSIDOSIS (MAN2B1) negative ALPHA-THALASSEMIA (HBA1/HBA2) negative ALPORT SYNDROME, COL4A3-RELATED (COL4A3) negative

ALPORT SYNDROME, COL4A4-RELATED (COL4A4) negative ALSTROM SYNDROME (ALMS1) negative AMISH INFANTILE EPILEPSY SYNDROME (573GAL5) negative

ANDERMANN SYNDROME (SLC12A6) negative

ARGININE:GLYCINE AMIDINOTRANSFERASE DEFICIENCY (AGAT DEFICIENCY)

ARGININE. SETCINE AMIDINO FRANSFERASE DEFICIENCY (GATM) negative
ARGININEMIA (ARG1) negative
ARGININOSUCCINATE LYASE DEFICIENCY (ASL) negative
AROMATASE DEFICIENCY (CYP19A1) negative
ASPARAGINE SYNTHETASE DEFICIENCY (ASNS) negative

ASPARTAGINE SYNTHETASE DEFICIENCY (ASMS) negative
ASPARTYLGLYCOSAMINURIA (AGA) negative
ATAXIA WITH VITAMIN E DEFICIENCY (TTPA) negative
ATAXIA-TELANGIECTASIA (ATM) negative
ATAXIA-TELANGIECTASIA-LIKE DISORDER 1 (MRE11) negative

ATRANSFERRINEMIA (TF) negative
AUTISM SPECTRUM, EPILEPSY AND ARTHROGRYPOSIS (SLC35A3) negative

AUTOIMMUNE POLYGLANDULAR SYNDROME, TYPE 1 (AIRE) negative AUTOSOMAL RECESSIVE CONGENITAL ICHTHYOSIS (ARCI), SLC27A4-RELATED

(SLC27A4) negative

AUTOSOMAL RECESSIVE SPASTIC ATAXIA OF CHARLEVOIX-SAGUENAY (SACS) negative

BARDET-BIEDL SYNDROME, ARL6-RELATED (ARL6) negative BARDET-BIEDL SYNDROME, BBS10-RELATED (BBS10) negative BARDET-BIEDL SYNDROME, BBS10-RELATED (BBS10) negative BARDET-BIEDL SYNDROME, BBS12-RELATED (BBS12) negative BARDET-BIEDL SYNDROME, BBS1-RELATED (BBS1) negative BARDET-BIEDL SYNDROME, BBS2-RELATED (BBS2) negative BARDET-BIEDL SYNDROME, BBS4-RELATED (BBS4) negative BARDET-BIEDL SYNDROME, BBS5-RELATED (BBS5) negative BARDET-BIEDL SYNDROME, BBS7-RELATED (BBS5) negative BARDET-BIEDL SYNDROME, BBS7-RELATED (BBS5) negative BARDET-BIEDL SYNDROME, BBS7-RELATED (BBS5) negative BARDET-BIEDL SYNDROME, TTC8-RELATED (TTC8) negative BART LYMPHOCYTE SYNDROME, CIITA-RELATED (CIITA) negative BARTTER SYNDROME, BSND-RELATED (BSND) negative BARTTER SYNDROME, KCNJ1-RELATED (KCNJ1) negative BARTTER SYNDROME, SLC12A1-RELATED (SLC12A1) negative BATTEN DISEASE, CLN3-RELATED (CLN3) negative BETA-HEMOGLOBINOPATHIES (HBB) negative BETA-KETOTHIOLASE DEFICIENCY (ACAT1) negative BETA-MANNOSIDOSIS (MANBA) negative
BETA-UREIDOPROPIONASE DEFICIENCY (UPB1) negative BILATERAL FRONTOPARIETAL POLYMICROGYRIA (GPR56) negative BIOTINIDASE DEFICIENCY (BTD) negative BIOTIN-THIAMINE-RESPONSIVE BASAL GANGLIA DISEASE (BTBGD) (SLC19A3) negative

BLOOM SYNDROME (*BLM*) negative BRITTLE CORNEA SYNDROME 1 (*ZNF469*) negative BRITTLE CORNEA SYNDROME 2 (*PRDM5*) negative

CANAVAN DISEASE (ASPA) negative CARBAMOYL PHOSPHATE SYNTHETASE I DEFICIENCY (CPS1) negative

CARNITINE DEFICIENCY (SLC22A5) negative
CARNITINE PALMITOYLTRANSFERASE IA DEFICIENCY (CPT1A) negative
CARNITINE PALMITOYLTRANSFERASE II DEFICIENCY (CPT2) negative

CARNITINE-ACYLCARNITINE TRANSLOCASE DEFICIENCY (SLC25A20) negative

CARPENTER SYNDROME (RAB23) negative
CARTILAGE-HAIR HYPOPLASIA (RMRP) negative
CATECHOLAMINERGIC POLYMORPHIC VENTRICULAR TACHYCARDIA (CASQ2) negative

CD59-MEDIATED HEMOLYTIC ANEMIA (CD59) negative CEP152-RELATED MICROCEPHALY (CEP152) negative CEREBRAL DYSGENESIS, NEUROPATHY, ICHTHYOSIS, AND PALMOPLANTAR

KERATODERMA (CEDNIK) SYNDROME (SNAP29) negative
CEREBROTENDINOUS XANTHOMATOSIS (CYP27A1) negative
CHARCOT-MARIE-TOOTH DISEASE, RECESSIVE INTERMEDIATE C (PLEKHG5) negative

CHARCOT-MARIE-TOOTH-DISEASE, TYPE 4D (NDRG1) negative

CHEDIAK-HIGASHI SYNDROME (LYST) negative CHOREOACANTHOCYTOSIS (VPS13A) negative CHRONIC GRANULOMATOUS DISEASE, CYBA-RELATED (CYBA) negative

CHRONIC GRANULOMATOUS DISEASE, NCF2-RELATED (NCF2) negative CILIOPATHIES, RPGRIP1L-RELATED (RPGRIP1L) negative CITRIN DEFICIENCY (SLC25A13) negative

CITRULLINEMIA, TYPE 1 (ASS1) negative

CLN10 DISEASE (CTSD) negative COHEN SYNDROME (VPS13B) negative

COHEN STADROME (VP513B) negative
COL11A2-RELATED CONDITIONS (COL11A2) negative
COMBINED MALONIC AND METHYLMALONIC ACIDURIA (ACSF3) negative
COMBINED OXIDATIVE PHOSPHORYLATION DEFICIENCY 1 (GFM1) negative
COMBINED OXIDATIVE PHOSPHORYLATION DEFICIENCY 3 (TSFM) negative

COMBINED PITUITARY HORMONE DEFICIENCY 1 (POU1F1) negative

COMBINED PITUITARY HORMONE DEFICIENCY-2 (PROP1) negative CONGENITAL ADRENAL HYPERPLASIA, 11-BETA-HYDROXYLASE DEFICIENCY

(CYP11B1) negative

CONGENITAL ADRENAL HYPERPLASIA, 17-ALPHA-HYDROXYLASE DEFICIENCY

(CYP17A1) negative
CONGENITAL ADRENAL HYPERPLASIA, 21-HYDROXYLASE DEFICIENCY (CYP21A2) see

CONGENITAL ADRENAL INSUFFICIENCY, CYP11A1-RELATED (CYP11A1) negative CONGENITAL AMEGAKARYOCYTIC THROMBOCYTOPENIA (MPL) negative CONGENITAL CHRONIC DIARRHEA (DGAT1) negative

CONGENITAL DISORDER OF GLYCOSYLATION TYPE 1, ALG1-RELATED (ALG1) negative CONGENITAL DISORDER OF GLYCOSYLATION, TYPE 1A, PMM2-Related (PMM2) negative CONGENITAL DISORDER OF GLYCOSYLATION, TYPE 1B (MPI) negative

CONGENITAL DISORDER OF GLYCOSYLATION, TYPE 1C (ALG6) negative

CONGENITAL DYSERYTHROPOIETIC ANEMIA TYPE 2 (SEC23B) negative CONGENITAL FINNISH NEPHROSIS (NPHS1) negative CONGENITAL HYDROCEPHALUS 1 (CCDC88C) negative

CONGENITAL HYDROCEPHALDS 1 (CCDC88C) negative
CONGENITAL HYPERINSULINISM, KCNJ11-Related (KCNJ11) negative
CONGENITAL INSENSITIVITY TO PAIN WITH ANHIDROSIS ( CIPA ) (NTRK1) negative
CONGENITAL MYASTHENIC SYNDROME, CHAT-RELATED (CHAT) negative
CONGENITAL MYASTHENIC SYNDROME, CHRNE-RELATED (CHRNE) negative
CONGENITAL MYASTHENIC SYNDROME, COLQ-RELATED (COLQ) negative
CONGENITAL MYASTHENIC SYNDROME, DOK7-RELATED (DOK7) negative

CONGENITAL MYASTHENIC SYNDROME, RAPSN-RELATED (RAPSN) negative

CONGENITAL NEPHROTIC SYNDROME, NATATIALEATED (NATATIAL INEGATIVE CONGENITAL NEPHROTIC SYNDROME, PLCE1-RELATED (PLCE1) see first page CONGENITAL NEUTROPENIA, G6PC3-RELATED (G6PC3) negative CONGENITAL NEUTROPENIA, HAX1-RELATED (HAX1) negative

CONGENITAL NEUTROPENIA, HAAT-KELATED (HAXT) negative CONGENITAL SECRETORY CHLORIDE DIARRHEA 1 (SLC26A3) negative CORNEAL DYSTROPHY AND PERCEPTIVE DEAFNESS (SLC4A11) negative CORTICOSTERONE METHYLOXIDASE DEFICIENCY (CYP11B2) negative

COSTEFF SYNDROME (3-METHYLGLUTACONIC ACIDURIA, TYPE 3) (OPA3) negative CRB1-RELATED RETINAL DYSTROPHIES (CRB1) negative CYSTIC FIBROSIS (CFTR) negative

CYSTINOSIS (CTNS) negative

CYTOCHROME C OXIONSE DEFICIENCY, PET100-RELATED (PET100) negative CYTOCHROME P450 OXIOREDUCTASE DEFICIENCY (POR) negative

## **Testing Methodology, Limitations, and Comments:**

## **Next-generation sequencing (NGS)**

Sequencing library prepared from genomic DNA isolated from a patient sample is enriched for targets of interest using standard hybridization capture protocols and PCR amplification (for targets specified below). NGS is then performed to achieve the standards of quality control metrics, including a minimum coverage of 99% of targeted regions at 20X sequencing depth. Sequencing data is aligned to human reference sequence, followed by deduplication, metric collection and variant calling (coding region +/- 20bp). Variants are then classified according to ACMGG/AMP standards of interpretation using publicly available databases including but not limited to ENSEMBL, HGMD Pro, ClinGen, ClinVar, 1000G, ESP and gnomAD. Variants predicted to be pathogenic or likely pathogenic for the specified diseases are reported. It should be noted that the data interpretation is based on our current understanding of the genes and variants at the time of reporting. Putative positive sequencing variants that do not meet internal quality standards or are within highly homologous regions are confirmed by Sanger sequencing or gene-specific long-range PCR as needed prior to reporting.

Copy Number Variant (CNV) analysis is limited to deletions involving two or more exons for all genes on the panel, in addition to specific known recurrent single-exon deletions. CNVs of small size may have reduced detection rate. This method does not detect gene inversions, single-exonic and sub-exonic deletions (unless otherwise specified), and duplications of all sizes (unless otherwise specified). Additionally, this method does not define the exact breakpoints of detected CNV events. Confirmation testing for copy number variation is performed by specific PCR, Multiplex Ligation-dependent Probe Amplification (MLPA), next generation sequencing, or other methodology.

This test may not detect certain variants due to local sequence characteristics, high/low genomic complexity, homologous sequence, or allele dropout (PCR-based assays). Variants within noncoding regions (promoter, 5'UTR, 3'UTR, deep intronic regions, unless otherwise specified), small deletions or insertions larger than 25bp, low-level mosaic variants, structural variants such as inversions, and/or balanced translocations may not be detected with this technology.

#### SPECIAL NOTES

For ABCC6, variants in exons 1-9 are not detected due to the presence of regions of high homology.

For CFTR, when the CFTR R117H variant is detected, reflex analysis of the polythymidine variations (5T, 7T and 9T) at the intron 9 branch/acceptor site of the CFTR gene will be performed.

For CYP21A2, targets were enriched using long-range PCR amplification, followed by next generation sequencing. Duplication analysis will only be performed and reported when c.955C>T (p.Q319\*) is detected. Sequencing and CNV analysis may have reduced sensitivity, if variants result from complex rearrangements, in trans with a gene deletion, or CYP21A2 gene duplication on one chromosome and deletion on the other chromosome. This analysis cannot detect sequencing variants located on the CYP21A2 duplicated copy.

For DDX11, only NM\_030653.3:c.1763 - 1G > C variant will be analyzed and reported.

For GJB2, CNV analysis of upstream deletions of GJB6-D13S1830 (309kb deletion) and GJB6-D13S1854 (232kb deletion) is included.

For HBA1/HBA2, CNV analysis is offered to detect common deletions of -alpha3.7, -alpha4.2, --MED, --SEA, --FIL, --THAI, --alpha20.5, and/or HS-40.

For OTOA, variants in exons 20 - 28 are not analyzed due to high sequence homology.

For RPGRIP1L, variants in exon 23 are not detected due to assay limitation.

For SAMD9, only p.K1495E variant will be analyzed and reported.

## Friedreich Ataxia (FXN)

The GAA repeat region of the FXN gene is assessed by trinucleotide PCR assay and capillary electrophoresis. Variances of +/-1 repeat for normal alleles and up to +/-3 repeats for premutation alleles may occur. For fully penetrant expanded alleles, the precise repeat size cannot be determined, therefore the approximate allele size is reported. Sequencing and copy number variants are analyzed by next-generation sequencing analysis.

## Friedreich Ataxia Repeat Categories

Categories	GAA Repeat Sizes
Normal	<34
Premutation	34 - 65
Full	>65

## Spinal Muscular Atrophy (SMN1)

The total combined copy number of SMN1 and SMN2 exon 7 is quantified based on NGS read depth. The ratio of SMN1 to SMN2 is calculated based on the read depth of a single nucleotide that distinguishes these two genes in exon 7. In addition to copy number analysis, testing for the presence or absence of a single nucleotide polymorphism (g.27134T>G in intron 7 of SMN1) associated with the presence of a SMN1 duplication allele is performed using NGS.

Report Date:

Ethnicity	Two SMN1 copies carrier risk before g.27134T>G testing	k before g.27134T>G testing Carrier risk after g.27134T>G testing	
		g.27134T>G ABSENT	g.27134T>G PRESENT

Ashkenazi Jewish	1 in 350	1 in 580	LIKELY CARRIER
Asian	1 in 628	1 in 702	LIKELY CARRIER
African-American	1 in 121	1 in 396	1 in 34
Hispanic	1 in 1061	1 in 1762	1 in 140

#### Variant Classification

Only pathogenic or likely pathogenic variants are reported. Other variants including benign variants, likely benign variants, variants of uncertain significance, or inconclusive variants identified during this analysis may be reported in certain circumstances. Our laboratory's variant classification criteria are based on the ACMG and internal guidelines and our current understanding of the specific genes. This interpretation may change over time as more information about a gene and/or variant becomes available. Natera and its lab partner(s) may reclassify variants at certain intervals but may not release updated reports without a specific request made to Natera by the ordering provider. Natera may disclose incidental findings if deemed clinically pertinent to the test performed.

## **Negative Results**

A negative carrier screening result reduces the risk for a patient to be a carrier of a specific disease but does not completely rule out carrier status. Please visit <a href="https://www.natera.com/panel-option/h-all/">https://www.natera.com/panel-option/h-all/</a> for a table of carrier rates, detection rates, residual risks and promised variants/exons per gene. Carrier rates before and after testing vary by ethnicity and assume a negative family history for each disease screened and the absence of clinical symptoms in the patient. Any patient with a family history for a specific genetic disease will have a higher carrier risk prior to testing and, if the disease-causing mutation in their family is not included on the test, their carrier risk would remain unchanged. Genetic counseling is recommended for patients with a family history of genetic disease so that risk figures based on actual family history can be determined and discussed along with potential implications for reproduction. Horizon carrier screening has been developed to identify the reproductive risks for monogenic inherited conditions. Even when one or both members of a couple screen negative for pathogenic variants in a specific gene, the disease risk for their offspring is not zero. There is still a low risk for the condition in their offspring due to a number of different mechanisms that are not detected by Horizon including, but not limited to, pathogenic variant(s) in the tested gene or in a different gene not included on Horizon, pathogenic variant(s) in an upstream regulator, uniparental disomy, de novo mutation(s), or digenic or polygenic inheritance.

#### **Additional Comments**

These analyses generally provide highly accurate information regarding the patient's carrier status. Despite this high level of accuracy, it should be kept in mind that there are many potential sources of diagnostic error, including misidentification of samples, polymorphisms, or other rare genetic variants that interfere with analysis. Families should understand that rare diagnostic errors may occur for these reasons.

Hemoglobin A	97.4	Reference Range: >96.0 %	(FINAL)		
Hemoglobin F	0.0	Reference Range: <2.0 %	(FINAL)		
Hemoglobin A2 (Quant)	2.6	Reference Range: 2.0-3.2 %	(FINAL)		
Interpretation			(FINAL)		

NORMAL PATTERN

There is a normal pattern of hemoglobins and normal levels of Hb A2 and Hb F are present. No variant hemoglobins are observed. This is consistent with A/A phenotype.

If iron deficiency coexists with a mild/silent beta thalassemia trait Hb A2 may be in the normal range. Rare variant hemoglobins have no separation from hemoglobin A by capillary zone electrophoresis (CZE) or high-performance liquid chromatography (HPLC). If clinically indicated, Thalassemia and Hemoglobinopathy Comprehensive (TC 17365) should be considered.

Chromosome Analysis, Blood
