

Donor 7090

Genetic Testing Summary

Fairfax Cryobank recommends reviewing this genetic testing summary with your healthcare provider to determine suitability.

Last Updated: 10/29/24

Donor Reported Ancestry: Mexican

Jewish Ancestry: No

Genetic Test*	Result	Comments/Donor's Residual Risk**
Chromosome analysis (karyotype)	Normal male karyotype	No evidence of clinically significant chromosome abnormalities
Hemoglobin evaluation	Normal hemoglobin fractionation and MCV/MCH results	Reduced risk to be a carrier for sickle cell anemia, beta thalassemia, alpha thalassemia trait (aa/-- and a-/a-) and other hemoglobinopathies
Expanded Genetic Disease Carrier Screening Panel attached- 549 diseases by gene sequencing.	<p>Carrier: Early Infantile Epileptic Encephalopathy, CAD-Related (CAD)</p> <p>Carrier: Primary Microcephaly 1 (MCPH1)</p> <p>Negative for other genes sequenced.</p>	Partner testing is recommended before using this donor.

*No single test can screen for all genetic disorders. A negative screening result significantly reduces, but cannot eliminate, the risk for these conditions in a pregnancy.

**Donor residual risk is the chance the donor is still a carrier after testing negative.

Patient Information

Patient Name: DONOR 7090
 Date Of Birth: [REDACTED]
 Gender: Male
 Ethnicity: Other

**CARRIER SCREENING REPORT**

ABOUT THIS SCREEN: Horizon™ is a carrier screen for specific autosomal recessive and X-linked diseases. This information can help patients learn their risk of having a child with specific genetic conditions.

ORDER SELECTED: The Horizon Custom panel was ordered for this patient. Males are not screened for X-linked diseases

FINAL RESULTS SUMMARY:**CARRIER for Early Infantile Epileptic Encephalopathy, CAD-Related**

Positive for the likely pathogenic variant c.4613C>T (p.S1538L) in the CAD gene. If this individual's partner is a carrier for EARLY INFANTILE EPILEPTIC ENCEPHALOPATHY, CAD-RELATED, their chance to have a child with this condition may be as high as 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

CARRIER for Primary Microcephaly 1, Autosomal Recessive

Positive for the likely pathogenic variant c.671-1G>A in the MCPH1 gene. If this individual's partner is a carrier for PRIMARY MICROCEPHALY 1, AUTOSOMAL RECESSIVE, their chance to have a child with this condition may be as high as 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

Negative for 547 out of 549 diseases

No other pathogenic variants were detected in the genes that were screened. The patient's remaining carrier risk after the negative screening results is listed for each disease/gene on the Horizon website at <https://www.natera.com/panel-option/h-all/>. Please see the following pages of this report for a comprehensive list of all conditions included on this individual's screen.

Carrier screening is not diagnostic and may not detect all possible pathogenic variants in a given gene.

RECOMMENDATIONS

Individuals who would like to review their Horizon report with a Natera Laboratory Genetic Counselor may schedule a telephone genetic information session by calling 650-249-9090 or visiting naterasession.com. Clinicians with questions may contact Natera at 650-249-9090 or email support@natera.com. Individuals with positive results may wish to discuss these results with family members to allow them the option to be screened. Comprehensive genetic counseling to discuss the implications of these test results and possible associated reproductive risk is recommended.

EARLY INFANTILE EPILEPTIC ENCEPHALOPATHY, CAD-RELATED**Understanding Your Horizon Carrier Screen Results****What does being a carrier mean?**

Your results show that you are a carrier of early infantile epileptic encephalopathy, CAD-related (EIEE50). A carrier of a genetic condition does not have the condition. Carriers also are not certain to have a child with the condition. We are all carriers of one or more genetic conditions. Your children are not at high risk for this condition unless your partner or donor is also a carrier of EIEE50. Further testing can be done to see if your partner or donor is a carrier.

What is early infantile epileptic encephalopathy, CAD-related (EIEE50)?

EIEE50 mainly affects the brain and nervous system. It is a form of epilepsy (seizure disorder) that varies from person to person. Some people have more severe symptoms than others. Infants with EIEE50 usually have symptoms shortly after birth. Symptoms can include seizures, feeding problems, low muscle tone, and breathing problems.^{1,2} Children with EIEE50 who survive infancy can have global developmental delay, seizures, low muscle tone, anemia, and abnormal movements.^{1,2} Many people with this condition do not live a normal lifespan. There is currently no cure for this condition. Treatment is based on symptoms.

Clinical trials involving potential new treatments for this condition could be available (see clinicaltrials.gov).

What causes early infantile epileptic encephalopathy, CAD-related (EIEE50)?

EIEE50 is caused by changes, or variants, in the CAD gene. These changes make the gene not work properly. Genes are a set of instructions inside the cells of our bodies that tell our bodies how to grow and function. Everyone has two copies of the CAD gene. Carriers of EIEE50 have one working copy and one non-working copy of the gene. People with EIEE50 have no working copies of the gene.

EIEE50 is usually passed down, or inherited, from both genetic parents. We inherit one copy of the CAD gene from each of our genetic parents. When both genetic parents are carriers, each child has a 1 in 4 (25%) chance of inheriting two non-working genes and having EIEE50. Each child also has a 1 in 2 (50%) chance of being a carrier of EIEE50 and a 1 in 4 (25%) chance of inheriting two working copies of the gene. This type of inheritance is called autosomal recessive inheritance.

Will my children have early infantile epileptic encephalopathy, CAD-related (EIEE50)?

If your partner or donor also has a non-working copy of the CAD gene, your children could have EIEE50. Each child you have together would have a 1 in 4 (25%) chance of having EIEE50. Each child you have together would also have a 3 in 4 (75%) chance of **not** having the condition.

If your partner or donor has CAD carrier screening and no variants are found, the chance that your children would have EIEE50 is very low. No further testing would usually be needed for you, your partner or donor, or your children related to EIEE50.

What can I do next?

If you want to know if your children are at risk for EIEE50, your partner or donor would need to have CAD carrier screening. If you have questions about this testing, please ask your healthcare provider or use the resources below. Many people find it helpful to speak with a genetic counselor.

If your partner or donor is found to be a EIEE50 carrier, your children would be at risk for having EIEE50.

If you or your partner or surrogate are currently pregnant, tests called CVS (chorionic villus sampling) and amniocentesis can be done during pregnancy to find out if a baby has EIEE50. These tests both have a small risk of miscarriage. Babies can also be tested for EIEE50 after birth instead.

If you or your partner or surrogate are not yet pregnant, you could have these options:

- natural pregnancy with CVS or amniocentesis to test for EIEE50 during pregnancy;
- natural pregnancy and testing the baby after birth for EIEE50;
- preimplantation genetic testing (PGT-M) with in vitro fertilization (IVF) to test embryos for EIEE50;
- adoption; or
- use of a sperm or egg donor who had no variants found in CAD carrier screening.

Where can I find more information?

- Epilepsy Foundation [epilepsy.com](https://www.epilepsy.com)
- CVS marchofdimes.org/chorionic-villus-sampling
- Amniocentesis marchofdimes.org/pregnancy/amniocentesis
- PGT-M natera.com/womens-health/spectrum-preimplantation-genetics

What does this mean for my family?

You likely got (inherited) this non-working gene from one of your genetic parents. Your genetic siblings and other family members could also carry it. You should tell your family members about your test results so they can decide if they want carrier screening for EIEE50.

PRIMARY MICROCEPHALY 1, AUTOSOMAL RECESSIVE

Understanding Your Horizon Carrier Screen Results

What is Primary Microcephaly 1, Autosomal Recessive?

Primary Microcephaly 1, Autosomal Recessive, is an inherited condition that affects the brain. Babies with this condition are born with a very small brain and skull (microcephaly). Most children with this condition have developmental delays, delays in speech and language skills, and mild to moderate intellectual disability. Some affected children also have short stature and/or seizures. Currently there is no cure for this condition and treatment is based on symptoms. Clinical trials involving potential new treatments for this condition may be available (see www.clinicaltrials.gov).

What causes Primary Microcephaly 1, Autosomal Recessive?

Primary Microcephaly 1, Autosomal Recessive, is caused by gene changes, or mutations, in both copies of the MCPH1 gene pair. These mutations cause the genes to not work properly or not work at all. When both copies of the MCPH1 gene do not work correctly it leads to the symptoms described above.

Primary Microcephaly 1, Autosomal Recessive, is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the MCPH1 gene to have a child with Primary Microcephaly 1, Autosomal Recessive. People who are carriers for Primary Microcephaly 1, Autosomal Recessive, are usually healthy and do not have the condition themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Primary Microcephaly 1, Autosomal Recessive, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their MCPH1 gene mutations to the child, who will then have this condition.

Individuals found to carry more than one mutation for Primary Microcephaly 1, Autosomal Recessive, should discuss their risk for having an affected child with their healthcare provider.

What can I do next?

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website (www.nsgc.org).

Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves.

If you are pregnant, your partner can have carrier screening for Primary Microcephaly 1, Autosomal Recessive, ordered by a healthcare professional. If your partner is not found to be a carrier of Primary Microcephaly 1, Autosomal Recessive, your risk of having an affected child is greatly reduced. Couples at risk of having a child with Primary Microcephaly 1, Autosomal Recessive, can opt to have prenatal diagnostic testing done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition.

If you are not yet pregnant, your partner can have carrier screening for Primary Microcephaly 1, Autosomal Recessive, ordered by a healthcare professional. If your partner is found to be a carrier for Primary Microcephaly 1, Autosomal Recessive, and your future children each have a 1 in 4, or 25%, chance of having the condition, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnostic testing of the fetus or testing the baby after birth for Primary Microcephaly 1, Autosomal Recessive,
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for Primary Microcephaly 1, Autosomal Recessive, or
- Adoption or use of a sperm or egg donor who is not a carrier for Primary Microcephaly 1, Autosomal Recessive.

VARIANT DETAILS**CAD, c.4613C>T (p.S1538L), heterozygous, likely pathogenic**

- The c.4613C>T (p.S1538L) variant in the CAD gene has been observed at a frequency of 0.0007% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with developmental and epileptic encephalopathy 50 (PMID: 37540500).
- Functional studies demonstrated that this variant causes reduced enzyme activity (PMID: 37540500).
- This variant has been reported in ClinVar [ID: 1701375].

MCPH1, c.671-1G>A, heterozygous, likely pathogenic

- The c.671-1G>A variant in the MCPH1 gene has not been observed in the gnomAD v2.1.1 dataset.
- This canonical splicing variant is predicted to maintain the reading frame but disrupt a significant percentage of the protein length or a critical region of the protein, potentially disrupting normal protein function.
- This variant has not been described in ClinVar.

DISEASES SCREENED

Below is a list of all diseases screened and the result. Certain conditions have unique patient-specific numerical values, therefore, results for those conditions are formatted differently.

Autosomal Recessive

- 1
17-BETA HYDROXYSTEROID DEHYDROGENASE 3 DEFICIENCY (*HSD17B3*) **negative**
- 3
3-BETA-HYDROXYSTEROID DEHYDROGENASE TYPE II DEFICIENCY (*HSD3B2*) **negative**
3-HYDROXY-3-METHYLGLUTARYL-COENZYME A LYASE DEFICIENCY (*HMGCL*) **negative**
3-HYDROXYACYL-COA DEHYDROGENASE DEFICIENCY (*HADH*) **negative**
3-METHYLCROTONYL-CoA CARBOXYLASE 2 DEFICIENCY (*MCC2C*) **negative**
3-PHOSPHOGLYCERATE DEHYDROGENASE DEFICIENCY (*PHGDH*) **negative**

- 5
5-ALPHA-REDUCTASE DEFICIENCY (*SRD5A2*) **negative**

- 6
6-PYRUVYL-TETRAHYDROPTERIN SYNTHASE (*PTPS*) DEFICIENCY (*PTS*) **negative**

- A**
ABCA4-RELATED CONDITIONS (*ABCA4*) **negative**
ABETALIPOPROTEINEMIA (*MTTP*) **negative**
ACHONDROGENESIS, TYPE 1B (*SLC26A2*) **negative**
ACHROMATOPSIA, CNGB3-RELATED (*CNGB3*) **negative**
ACRODERMATITIS ENTEROPATHICA (*SLC39A4*) **negative**
ACTION MYOCLONUS-RENAL FAILURE (AMRF) SYNDROME (*SCARB2*) **negative**
ACUTE INFANTILE LIVER FAILURE, TRMU-RELATED (*TRMU*) **negative**
ACYL-COA OXIDASE I DEFICIENCY (*ACOX1*) **negative**
AICARDI-GOUTIERES SYNDROME (*SAMHD1*) **negative**
AICARDI-GOUTIERES SYNDROME, RNASEH2A-RELATED (*RNASEH2A*) **negative**
AICARDI-GOUTIERES SYNDROME, RNASEH2B-RELATED (*RNASEH2B*) **negative**
AICARDI-GOUTIERES SYNDROME, RNASEH2C-RELATED (*RNASEH2C*) **negative**
AICARDI-GOUTIERES SYNDROME, TREX1-RELATED (*TREX1*) **negative**
ALPHA-MANNOSIDOSIS (*MAN2B1*) **negative**
ALPHA-THALASSEMIA (*HBA1/HBA2*) **negative**
ALPORT SYNDROME, COL4A3-RELATED (*COL4A3*) **negative**
ALPORT SYNDROME, COL4A4-RELATED (*COL4A4*) **negative**
ALSTROM SYNDROME (*ALMS1*) **negative**
AMISH INFANTILE EPILEPSY SYNDROME (*ST3GAL5*) **negative**
ANDERMANN SYNDROME (*SLC12A6*) **negative**
ARGININE:GLYCINE AMIDINOTRANSFERASE DEFICIENCY (AGAT DEFICIENCY) (*GATM*) **negative**
ARGININEMIA (*ARG1*) **negative**
ARGININOSUCCINATE LYASE DEFICIENCY (*ASL*) **negative**
AROMATASE DEFICIENCY (*CYP19A1*) **negative**
ASPARAGINE SYNTHETASE DEFICIENCY (*ASNS*) **negative**
ASPARTYLGLYCOSAMINURIA (*AGA*) **negative**
ATAXIA WITH VITAMIN E DEFICIENCY (*TTPA*) **negative**

 METHYLMALONIC ACIDEMIA, MCEE-RELATED (*MCEE*) **negative**
 METHYLMALONIC ACIDURIA AND HOMOCYSTINURIA, TYPE CBLC (*MMACHC*) **negative**
 METHYLMALONIC ACIDURIA AND HOMOCYSTINURIA, TYPE CblD (*MMADHC*) **negative**
 METHYLMALONIC ACIDURIA, MMAA-RELATED (*MMAA*) **negative**
 METHYLMALONIC ACIDURIA, MMAB-RELATED (*MMAB*) **negative**
 METHYLMALONIC ACIDURIA, TYPE MUT (0) (*MUT*) **negative**
 MEVALONIC KINASE DEFICIENCY (*MVK*) **negative**
 MICROCEPHALIC OSTEOPLASTIC PRIMORDIAL DWARFISM TYPE II (*PCNT*) **negative**
 MICROPTHALMIA / ANOPHTHALMIA, VSX2-RELATED (*VSX2*) **negative**
 MITOCHONDRIAL COMPLEX 1 DEFICIENCY, ACAD9-RELATED (*ACAD9*) **negative**
 MITOCHONDRIAL COMPLEX 1 DEFICIENCY, NDUFAF5-RELATED (*NDUFAF5*) **negative**
 MITOCHONDRIAL COMPLEX 1 DEFICIENCY, NDUFS6-RELATED (*NDUFS6*) **negative**
 MITOCHONDRIAL COMPLEX I DEFICIENCY, NUCLEAR TYPE 1 (*NDUFS4*) **negative**
 MITOCHONDRIAL COMPLEX I DEFICIENCY, NUCLEAR TYPE 10 (*NDUFAF2*) **negative**
 MITOCHONDRIAL COMPLEX I DEFICIENCY, NUCLEAR TYPE 17 (*NDUFAF6*) **negative**
 MITOCHONDRIAL COMPLEX I DEFICIENCY, NUCLEAR TYPE 19 (*FOXRED1*) **negative**
 MITOCHONDRIAL COMPLEX I DEFICIENCY, NUCLEAR TYPE 3 (*NDUFS7*) **negative**
 MITOCHONDRIAL COMPLEX I DEFICIENCY, NUCLEAR TYPE 4 (*NDUFV1*) **negative**
 MITOCHONDRIAL COMPLEX IV DEFICIENCY, NUCLEAR TYPE 2, SCO2-RELATED (*SCO2*) **negative**
 MITOCHONDRIAL COMPLEX IV DEFICIENCY, NUCLEAR TYPE 6 (*COX15*) **negative**
 MITOCHONDRIAL DNA DEPLETION SYNDROME 2 (*TK2*) **negative**

MITOCHONDRIAL DNA DEPLETION SYNDROME 3 (*DGUOK*) **negative**
 MITOCHONDRIAL MYOPATHY AND SIDEROBLASTIC ANEMIA (MLASA1) (*PUS1*) **negative**
 MITOCHONDRIAL TRIFUNCTIONAL PROTEIN DEFICIENCY, HADHB-RELATED (*HADHB*) **negative**
 MOLYBDENUM COFACTOR DEFICIENCY TYPE B (*MOC52*) **negative**
 MOLYBDENUM COFACTOR DEFICIENCY, TYPE A (*MOC51*) **negative**
 MUCOLIPIDOSIS II/III A (*GNPTAB*) **negative**
 MUCOLIPIDOSIS III GAMMA (*GNPTG*) **negative**
 MUCOLIPIDOSIS, TYPE IV (*MCOLN1*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE I (HURLER SYNDROME) (*IDUA*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE III A (SANFILIPPO A) (*SGSH*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE III B (SANFILIPPO B) (*NAGLU*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE III C (SANFILIPPO C) (*HGSNAT*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE III D (SANFILIPPO D) (*GNS*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE VI (MORQUIO SYNDROME) (*GALNS*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE IV B/GM1 GANGLIOSIDOSIS (*GLB1*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE IX (*HYAL1*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE VI (MAROTEAUX-LAMY) (*ARSB*) **negative**
 MUCOPOLYSACCHARIDOSIS, TYPE VII (*GUSB*) **negative**
 MULIBREY NANISM (*TRIM37*) **negative**
 MULTIPLE PTERYGIUM SYNDROME, CHRNG-RELATED/ESCOBAR SYNDROME (*CHRNG*) **negative**
 MULTIPLE SULFATASE DEFICIENCY (*SUMF1*) **negative**
 MUSCLE-EYE-BRAIN DISEASE, POMGNT1-RELATED (*POMGNT1*) **negative**
 MUSCULAR DYSTROPHY-DYSTROGLYCANOPATHY (*RXYLT1*) **negative**
 MUSK-RELATED CONGENITAL MYASTHENIC SYNDROME (*MUSK*) **negative**
 MYONEUROGASTROINTESTINAL ENCEPHALOPATHY (MNGIE) (*TYMP*) **negative**
 MYOTONIA CONGENITA (*CLCN1*) **negative**

N
 N-ACETYLGUTAMATE SYNTHASE DEFICIENCY (*NAGS*) **negative**
 NEMALINE MYOPATHY, NEB-RELATED (*NEB*) **negative**
 NEPHRONOPHTHISIS 1 (*NPHP1*) **negative**
 NEURONAL CEROID LIPOFUSCINOSIS, CLN5-RELATED (*CLN5*) **negative**
 NEURONAL CEROID LIPOFUSCINOSIS, CLN6-RELATED (*CLN6*) **negative**
 NEURONAL CEROID LIPOFUSCINOSIS, CLN8-RELATED (*CLN8*) **negative**
 NEURONAL CEROID LIPOFUSCINOSIS, MFSD8-RELATED (*MFSD8*) **negative**
 NEURONAL CEROID LIPOFUSCINOSIS, PPT1-RELATED (*PPT1*) **negative**
 NEURONAL CEROID LIPOFUSCINOSIS, TPP1-RELATED (*TPP1*) **negative**
 NGLY1-CONGENITAL DISORDER OF GLYCOSYLATION (*NGLY1*) **negative**
 NIEMANN-PICK DISEASE, TYPE C1 / D (*NPC1*) **negative**
 NIEMANN-PICK DISEASE, TYPE C2 (*NPC2*) **negative**
 NIEMANN-PICK DISEASE, TYPES A / B (*SMPD1*) **negative**
 NIJMEGEN BREAKAGE SYNDROME (*NBN*) **negative**
 NON-SYNDROMIC HEARING LOSS, GJB2-RELATED (*GJB2*) **negative**
 NON-SYNDROMIC HEARING LOSS, MYO15A-RELATED (*MYO15A*) **negative**
 NONSYNDROMIC HEARING LOSS, OTOA-RELATED (*OTOA*) **negative**
 NONSYNDROMIC HEARING LOSS, OTOF-RELATED (*OTOF*) **negative**
 NONSYNDROMIC HEARING LOSS, PJK-RELATED (*PJK*) **negative**
 NONSYNDROMIC HEARING LOSS, SYNE4-RELATED (*SYNE4*) **negative**
 NONSYNDROMIC HEARING LOSS, TMC1-RELATED (*TMC1*) **negative**

Testing Methodology, Limitations, and Comments:**Next-generation sequencing (NGS)**

Sequencing library prepared from genomic DNA isolated from a patient sample is enriched for targets of interest using standard hybridization capture protocols and PCR amplification (for targets specified below). NGS is then performed to achieve the standards of quality control metrics, including a minimum coverage of 99% of targeted regions at 20X sequencing depth. Sequencing data is aligned to human reference sequence, followed by deduplication, metric collection and variant calling (coding region +/- 20bp). Variants are then classified according to ACMGG/AMP standards of interpretation using publicly available databases including but not limited to ENSEMBL, HGMD Pro, ClinGen, ClinVar, 1000G, ESP and gnomAD. Variants predicted to be pathogenic or likely pathogenic for the specified diseases are reported. It should be noted that the data interpretation is based on our current understanding of the genes and variants at the time of reporting. Putative positive sequencing variants that do not meet internal quality standards or are within highly homologous regions are confirmed by Sanger sequencing or gene-specific long-range PCR as needed prior to reporting.

Copy Number Variant (CNV) analysis is limited to deletions involving two or more exons for all genes on the panel, in addition to specific known recurrent single-exon deletions. CNVs of small size may have reduced detection rate. This method does not detect gene inversions, single-exonic and sub-exonic deletions (unless otherwise specified), and duplications of all sizes (unless otherwise specified). Additionally, this method does not define the exact breakpoints of detected CNV events. Confirmation testing for copy number variation is performed by specific PCR, Multiplex Ligation-dependent Probe Amplification (MLPA), next generation sequencing, or other methodology.

This test may not detect certain variants due to local sequence characteristics, high/low genomic complexity, homologous sequence, or allele dropout (PCR-based assays). Variants within noncoding regions (promoter, 5'UTR, 3'UTR, deep intronic regions, unless otherwise specified), small deletions or insertions larger than 25bp, low-level mosaic variants, structural variants such as inversions, and/or balanced translocations may not be detected with this technology.

SPECIAL NOTES

For ABCC6, variants in exons 1-9 are not detected due to the presence of regions of high homology.

For CFTR, when the CFTR R117H variant is detected, reflex analysis of the polythymidine variations (5T, 7T and 9T) at the intron 9 branch/acceptor site of the CFTR gene will be performed.

For CYP21A2, targets were enriched using long-range PCR amplification, followed by next generation sequencing. Duplication analysis will only be performed and reported when c.955C>T (p.Q319*) is detected. Sequencing and CNV analysis may have reduced sensitivity, if variants result from complex rearrangements, in trans with a gene deletion, or CYP21A2 gene duplication on one chromosome and deletion on the other chromosome. This analysis cannot detect sequencing variants located on the CYP21A2 duplicated copy.

For DDX11, only NM_030653.3:c.1763 - 1G > C variant will be analyzed and reported.

For HBA1/HBA2, CNV analysis is offered to detect common deletions of -alpha3.7, -alpha4.2, --MED, --SEA, --FIL, --THAI, --alpha20.5, and/or HS-40.

For OTOA, variants in exons 20 - 28 are not analyzed due to high sequence homology.

For RPGRIP1L, variants in exon 23 are not detected due to assay limitation.

For SAMD9, only p.K1495E variant will be analyzed and reported.

Friedreich Ataxia (FXN)

The GAA repeat region of the FXN gene is assessed by trinucleotide PCR assay and capillary electrophoresis. Variances of +/-1 repeat for normal alleles and up to +/-3 repeats for premutation alleles may occur. For fully penetrant expanded alleles, the precise repeat size cannot be determined, therefore the approximate allele size is reported. Sequencing and copy number variants are analyzed by next-generation sequencing analysis.

Friedreich Ataxia Repeat Categories

Categories	GAA Repeat Sizes
Normal	<34
Premutation	34 - 65
Full	>65

Spinal Muscular Atrophy (SMN1)

The total combined copy number of SMN1 and SMN2 exon 7 is quantified based on NGS read depth. The ratio of SMN1 to SMN2 is calculated based on the read depth of a single nucleotide that distinguishes these two genes in exon 7. In addition to copy number analysis, testing for the presence or absence of a single nucleotide polymorphism (g.27134T>G in intron 7 of SMN1) associated with the presence of a SMN1 duplication allele is performed using NGS.

Ethnicity	Two SMN1 copies carrier risk before g.27134T>G testing	Carrier risk after g.27134T>G testing	
		g.27134T>G ABSENT	g.27134T>G PRESENT
Caucasian	1 in 632	1 in 769	1 in 29
Ashkenazi Jewish	1 in 350	1 in 580	LIKELY CARRIER
Asian	1 in 628	1 in 702	LIKELY CARRIER
African-American	1 in 121	1 in 396	1 in 34
Hispanic	1 in 1061	1 in 1762	1 in 140

Variant Classification

Only pathogenic or likely pathogenic variants are reported. Other variants including benign variants, likely benign variants, variants of uncertain significance, or inconclusive variants identified during this analysis may be reported in certain circumstances. Our laboratory's variant classification criteria are based on the ACMG and internal guidelines and our current understanding of the specific genes. This interpretation may change over time as more information about a gene and/or variant becomes available. Natera and its lab partner(s) may reclassify variants at certain intervals but may not release updated reports without a specific request made to Natera by the ordering provider. Natera may disclose incidental findings if deemed clinically pertinent to the test performed.

Negative Results

A negative carrier screening result reduces the risk for a patient to be a carrier of a specific disease but does not completely rule out carrier status. Please visit <https://www.natera.com/panel-option/h-all/> for a table of carrier rates, detection rates, residual risks and promised variants/exons per gene. Carrier rates before and after testing vary by ethnicity and assume a negative family history for each disease screened and the absence of clinical symptoms in the patient. Any patient with a family history for a specific genetic disease will have a higher carrier risk prior to testing and, if the disease-causing mutation in their family is not included on the test, their carrier risk would remain unchanged. Genetic counseling is recommended for patients with a family history of genetic disease so that risk figures based on actual family history can be determined and discussed along with potential implications for reproduction. Horizon carrier screening has been developed to identify the reproductive risks for monogenic inherited conditions. Even when one or both members of a couple screen negative for pathogenic variants in a specific gene, the disease risk for their offspring is not zero. There is still a low risk for the condition in their offspring due to a number of different mechanisms that are not detected by Horizon including, but not limited to, pathogenic variant(s) in the tested gene or in a different gene not included on Horizon, pathogenic variant(s) in an upstream regulator, uniparental disomy, de novo mutation(s), or digenic or polygenic inheritance.

Additional Comments

These analyses generally provide highly accurate information regarding the patient's carrier status. Despite this high level of accuracy, it should be kept in mind that there are many potential sources of diagnostic error, including misidentification of samples, polymorphisms, or other rare genetic variants that interfere with analysis. Families should understand that rare diagnostic errors may occur for these reasons.

Hemoglobin A2 (Quant)	3.1	Reference Range: 2.2-3.2 %	FINAL

Interpretation

NORMAL PATTERN

There is a normal pattern of hemoglobins and normal levels of Hb A2 and Hb F are present. No variant hemoglobins are observed. This is consistent with A/A phenotype. If iron deficiency coexists with a mild/silent beta thalassemia trait Hb A2 may be in the normal range. Rare variant hemoglobins have no separation from hemoglobin A by capillary zone electrophoresis (CZE) or high-performance liquid chromatography (HPLC). If clinically indicated, Thalassemia and Hemoglobinopathy Comprehensive (TC 17365) should be considered.

CBC (includes Differential and Platelets)
