

**SPERM DONOR GENETIC TESTING SUMMARY**

**Donor # 7196**

Fairfax Cryobank recommends reviewing this genetic testing summary with your healthcare provider to determine suitability.

Last Updated: 11/13/2025

Donor Reported Ancestry: Ukrainian

Jewish Ancestry: No

Genetic Test*	Result	Comments Donor's Residual Risk**
Chromosome analysis (karyotype)	Normal male karyotype	No evidence of clinically significant chromosome abnormalities
Hemoglobin evaluation	Normal hemoglobin fractionation and MCV/MCH results	Reduced risk to be a carrier for sickle cell anemia, beta thalassemia, alpha thalassemia trait (aa/-- and a-/a-) and other hemoglobinopathies
Expanded Genetic Disease Carrier Screening Panel attached - 549 diseases by gene sequencing and del/dup analysis.	<p>Carrier: Non-Syndromic Hearing Loss, GJB2-Related (GJB2)</p> <p>Carrier: Smith-Lemli-Opitz Syndrome (DHCR7)</p> <p>Carrier: Steroid-Resistant Nephrotic Syndrome (NPHS2)</p> <p>Negative for other genes tested.</p>	Partner testing is recommended before using this donor.

\*No single test can screen for all genetic disorders. A negative screening result significantly reduces, but cannot eliminate, the risk for these conditions in a pregnancy.

\*\*Donor residual risk is the chance the donor is still a carrier after testing negative.

**Patient Information**  
 Patient Name: Donor 7196  
 Date Of Birth: [REDACTED]  
 Gender: Male  
 Patient ID: N/A  
 Medical Record #: N/A  
 Collection Kit: [REDACTED]  
 Accession ID: N/A  
 Case File ID: [REDACTED]  
 Ethnicity: Other

**Test Information**  
 Ordering Physician: [REDACTED]  
 Clinic Information: Fairfax Cryobank  
 Phone: [REDACTED]  
 Report Date: 09/22/2025  
 Sample Collected: 09/08/2025  
 Sample Received: 09/09/2025  
 Sample Type: Blood

## CARRIER SCREENING REPORT

**ABOUT THIS SCREEN:** Horizon™ is a carrier screen for specific autosomal recessive and X-linked diseases. This information can help patients learn their risk of having a child with specific genetic conditions.

**ORDER SELECTED:** The Horizon Custom panel was ordered for this patient. Males are not screened for X-linked diseases

### FINAL RESULTS SUMMARY:

#### CARRIER for Non-Syndromic Hearing Loss, GJB2-Related

Positive for the pathogenic variant c.101T>C (p.M34T) in the GJB2 gene. This variant has been reported to have variable penetrance, and some individuals with a pathogenic variant on the opposite allele may not have hearing loss. If this individual's partner is a carrier for NON-SYNDROMIC HEARING LOSS, GJB2-RELATED, their chance to have a child with this condition is 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

#### CARRIER for Smith-Lemli-Opitz Syndrome

Positive for the pathogenic variant c.452G>A (p.W151\*) in the DHCR7 gene. If this individual's partner is a carrier for SMITH-LEMLI-OPITZ SYNDROME, their chance to have a child with this condition is 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

#### CARRIER for Steroid-Resistant Nephrotic Syndrome

Positive for the likely pathogenic variant c.686G>A (p.R229Q) in the NPHS2 gene. The c.686G>A (p.R229Q) variant is a mild variant that is only expected to cause disease when found in trans with a subset of variants (PMID: 30260545, 30241959, 25349199). Homozygotes are not expected to be affected, unless present as part of a complex allele (PMID: 24509478 and 29660491). If this individual's partner is a carrier for Steroid-Resistant Nephrotic Syndrome, their chance to have a child with this condition may be as high as 1 in 4 (25%). Carrier screening for this individual's partner is suggested.

### Negative for 546 out of 549 diseases

No other pathogenic variants were detected in the genes that were screened. The patient's remaining carrier risk after the negative screening results is listed for each disease/gene on the Horizon website at <https://www.natera.com/panel-option/h-all/>. Please see the following pages of this report for a comprehensive list of all conditions included on this individual's screen.

Carrier screening is not diagnostic and may not detect all possible pathogenic variants in a given gene.

#### RECOMMENDATIONS

Individuals who would like to review their Horizon report with a Natera Laboratory Genetic Counselor may schedule a telephone genetic information session by calling 650-249-9090 or visiting [naterasession.com](https://naterasession.com). Clinicians with questions may contact Natera at 650-249-9090 or email [support@natera.com](mailto:support@natera.com). Individuals with positive results may wish to discuss these results with family members to allow them the option to be screened. Comprehensive genetic counseling to discuss the implications of these test results and possible associated reproductive risk is recommended.

**NON-SYNDROMIC HEARING LOSS, GJB2-RELATED****Understanding Your Horizon Carrier Screen Results****What is Non-Syndromic Hearing Loss, GJB2-Related?**

Non-Syndromic Hearing Loss, GJB2-Related (also called DFNB1) is an inherited disorder that causes early-onset hearing loss. "Non-syndromic" means that no other parts of the body are affected, making hearing loss the only symptom of this condition. In Non-Syndromic Hearing Loss, GJB2-Related, hearing loss is typically present at birth (congenital). However, some children have normal hearing at birth and develop hearing loss during childhood. The severity varies from mild to profound sensorineural hearing loss. The treatment for hearing loss includes hearing aids and, in some cases, cochlear implants. Clinical trials involving potential new treatments for this condition may be available (see [www.clinicaltrials.gov](http://www.clinicaltrials.gov)). Non-Syndromic Hearing Loss, GJB2-Related does not cause other health problems.

**What causes Non-Syndromic Hearing Loss, GJB2-Related?**

Non-Syndromic Hearing Loss, GJB2-Related is caused by a gene change, or mutation, in both copies of the GJB2 gene pair (also known as DFNB1). These mutations cause the genes to not work properly or not work at all. The function of the GJB2 genes is to make a protein that is important for hearing. When both copies of the GJB2 gene do not work correctly, it leads to Non-Syndromic Hearing Loss, GJB2- Related. Non-Syndromic Hearing Loss, GJB2-Related is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the GJB2 gene to have a child with Non-Syndromic Hearing Loss, GJB2-Related. People who are carriers for Non-Syndromic Hearing Loss, GJB2-Related are usually healthy and usually do not have Non-Syndromic Hearing Loss themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Non-Syndromic Hearing Loss, GJB2- Related, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their GJB2 gene mutations to the child, who will then have Non-Syndromic Hearing Loss, GJB2-Related. Very rarely, carriers of a single GJB2 mutation will have inherited hearing loss with or without other symptoms. These individuals usually have one parent who is also affected. This type of inheritance, where having only one mutation causes symptoms, is called autosomal dominant. When a person with autosomal dominant hearing loss has a child, there is a 50%, or 1 in 2, chance with each pregnancy of having a child who will also develop this type of hearing loss. It is sometimes, but not always, possible to determine whether a specific mutation in the GJB2 gene will cause autosomal recessive Non-Syndromic Hearing Loss or an autosomal dominant type of hearing loss. Individuals found to carry more than one mutation for Non-Syndromic Hearing Loss, GJB2-Related should discuss their risk for having an affected child and any potential effects to their own hearing with their health care provider.

**What can I do next?**

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website ([www.nsgc.org](http://www.nsgc.org)). You may wish to share your carrier screening results with your health care providers, especially if you have a family history of hearing loss or have concerns about your own hearing. Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for Non-Syndromic Hearing Loss, GJB2- Related ordered by a health care professional. If your partner is not found to be a carrier for Non-Syndromic Hearing Loss, GJB2-Related, your risk of having a child with Non-Syndromic Hearing Loss, GJB2-Related is greatly reduced. Couples at risk of having a baby with Non-Syndromic Hearing Loss, GJB2-Related can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to test the baby after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for Non-Syndromic Hearing Loss, GJB2-Related ordered by a health care professional. If your partner is found to be a carrier for Non-Syndromic Hearing Loss, GJB2-Related, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnosis of the fetus or testing the baby after birth for Non-Syndromic Hearing Loss, GJB2- Related
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for Non-Syndromic Hearing Loss, GJB2-Related
- Adoption or use of a sperm or egg donor who is not a carrier for Non-Syndromic Hearing Loss, GJB2- Related

**SMITH-LEMLI-OPITZ SYNDROME****Understanding Your Horizon Carrier Screen Results****What is Smith-Lemli-Opitz Syndrome?**

Smith-Lemli-Opitz (SLO) Syndrome is an inherited disorder that causes slow growth, small head size, moderate-to-severe intellectual disability, heart defects, cleft palate (opening at the roof of the mouth) and other birth defects. Lifespan in children with SLO Syndrome is often shortened and death occurs before age 2 in up to a third of affected children. The condition varies from person to person and rare individuals with SLO Syndrome have fewer symptoms and mild to no intellectual disability. Currently there is no cure for this condition and treatment is based on symptoms. Clinical trials involving potential new treatments for this condition may be available (see [www.clinicaltrials.gov](http://www.clinicaltrials.gov)).

**What causes Smith-Lemli-Opitz Syndrome?**

SLO Syndrome is caused by a gene change, or mutation, in both copies of the DHCR7 gene pair. These mutations cause the genes to not work properly or not work at all. The function of the DHCR7 genes is to help produce cholesterol. When there are mutations in both copies of this gene, body cells do not make enough cholesterol and toxic chemicals build up in the blood, nervous system, and other tissues and cause the symptoms described above. Increasing dietary cholesterol cannot cure SLO Syndrome and has not been proven to be helpful in improving symptoms. SLO Syndrome is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the DHCR7 gene to have a child with SLO Syndrome. People who are carriers for SLO Syndrome are usually healthy and do not have symptoms nor do they have SLO Syndrome themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for SLO Syndrome, there is a 1 in 4, or 25%, chance in each pregnancy to have a child with this condition. Individuals found to carry more than one mutation for SLO Syndrome should discuss their risk for having an affected child with their health care provider.

**What can I do next?**

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website ([www.nsgc.org](http://www.nsgc.org)). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for SLO Syndrome ordered by a health care professional. If your partner is not found to be a carrier for SLO Syndrome, your risk of having a child with SLO Syndrome is greatly reduced. Couples at risk of having a baby with SLO Syndrome can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for SLO Syndrome ordered by a health care professional. If your partner is found to be a carrier for SLO Syndrome, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnostic testing of the fetus or testing the baby after birth for SLO Syndrome
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for SLO Syndrome
- Adoption or use of a sperm or egg donor who is not a carrier for SLO Syndrome

**STEROID-RESISTANT NEPHROTIC SYNDROME****Understanding Your Horizon Carrier Screen Results****What is Steroid-Resistant Nephrotic Syndrome?**

Steroid-Resistant Nephrotic Syndrome (also known as Familial Nephrotic Syndrome or Nephrotic Syndrome, Type 2) is an inherited disorder that causes abnormal kidney function. People with this condition have large amounts of protein in their urine, low amounts of albumin (a protein in the plasma of the blood), high levels of fat in the blood, and excess fluid in body tissues (edema). Symptoms vary from person to person and usually start in infancy or childhood, although some people do not show symptoms until early adulthood. The kidney problems worsen over time, often leading to kidney failure in childhood, the teenage years, or early adulthood. Once kidney failure occurs, dialysis and then kidney transplantation are needed. Currently there is no cure for this condition and treatment is based on symptoms. Clinical trials involving potential new treatments for this condition may be available (see [www.clinicaltrials.gov](http://www.clinicaltrials.gov)).

**What causes Steroid-Resistant Nephrotic Syndrome?**

Steroid-Resistant Nephrotic Syndrome is caused by a gene change, or mutation, in both copies of the NPHS2 gene pair. These mutations cause the genes to not work properly or not work at all. When both copies of this gene do not work correctly, it leads to the symptoms described above. Steroid-Resistant Nephrotic Syndrome is inherited in an autosomal recessive manner. This means that, in most cases, both parents must be carriers of a mutation in one copy of the NPHS2 gene to have a child with Steroid-Resistant Nephrotic Syndrome. People who are carriers for Steroid-Resistant Nephrotic Syndrome are usually healthy and do not have symptoms nor do they have Steroid-Resistant Nephrotic Syndrome themselves. Usually a child inherits two copies of each gene, one copy from the mother and one copy from the father. If the mother and father are both carriers for Steroid-Resistant Nephrotic Syndrome, there is a 1 in 4, or 25%, chance in each pregnancy for both partners to pass on their NPHS2 gene mutations to the child, who would then have this condition. Individuals found to carry more than one mutation for Steroid-Resistant Nephrotic Syndrome should discuss any potential effects to their own health and their risk for having an affected child with their health care provider.

**What can I do next?**

You may wish to speak with a local genetic counselor about your carrier test results. A genetic counselor in your area can be located on the National Society of Genetic Counselors website ([www.nsgc.org](http://www.nsgc.org)). Your siblings and other relatives are at increased risk to also have this mutation. You are encouraged to inform your family members of your test results as they may wish to consider being tested themselves. If you are pregnant, your partner can have carrier screening for Steroid-Resistant Nephrotic Syndrome ordered by a health care professional. If your partner is not found to be a carrier for Steroid-Resistant Nephrotic Syndrome, your risk of having a child with this condition is greatly reduced. Couples at risk of having a baby with Steroid-Resistant Nephrotic Syndrome can opt to have prenatal diagnosis done through chorionic villus sampling (CVS) or amniocentesis during pregnancy or can choose to have the baby tested after birth for this condition. If you are not yet pregnant, your partner can have carrier screening for Steroid-Resistant Nephrotic Syndrome ordered by a health care professional. If your partner is found to be a carrier for Steroid-Resistant Nephrotic Syndrome, you have several reproductive options to consider:

- Natural pregnancy with or without prenatal diagnosis of the fetus or testing the baby after birth for Steroid-Resistant Nephrotic Syndrome
- Preimplantation genetic diagnosis (PGD) with in vitro fertilization (IVF) to test embryos for Steroid-Resistant Nephrotic Syndrome
- Adoption or use of a sperm or egg donor who is not a carrier for Steroid-Resistant Nephrotic Syndrome

Report Date: 09/22/2025

**VARIANT DETAILS****DHCR7, c.452G>A (p.W151\*), pathogenic**

- The c.452G>A (p.W151\*) variant in the DHCR7 gene has been observed at a frequency of 0.0776% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with Smith-Lemli-Opitz syndrome (PMID: 9653161).
- This premature termination variant is predicted to cause nonsense-mediated decay (NMD) in a gene where loss-of-function is a known mechanism of disease.
- This variant has been reported in ClinVar [ID: 21273].

**GJB2, c.101T>C (p.M34T), pathogenic**

- The c.101T>C (p.M34T) variant in the GJB2 gene has been observed at a frequency of 0.8996% in the gnomAD v2.1.1 dataset.
- This variant has been reported in a homozygous state or in conjunction with another variant in individual(s) with mild hearing loss and reduced penetrance (PMID: 16380907, 17935238).
- This variant has been reported in ClinVar [ID: 17000].

**NPHS2, c.686G>A (p.R229Q), likely pathogenic**

- The c.686G>A (p.R229Q) variant in the NPHS2 gene has been observed at a frequency of 3.0245% in the gnomAD v2.1.1 dataset.
- This variant is a mild variant that is only expected to cause disease when found in trans with a subset of variants (PMID: 30260545, 30241959, 25349199). Homozygotes are not expected to be affected, unless present as part of a complex allele (PMID: 24509478 and 29660491).
- This variant has been reported in ClinVar [ID: 5370].

**DISEASES SCREENED**

Below is a list of all diseases screened and the result. Certain conditions have unique patient-specific numerical values, therefore, results for those conditions are formatted differently.

**Autosomal Recessive**

1  
17-BETA HYDROXYSTEROID DEHYDROGENASE 3 DEFICIENCY (*HSD17B3*) **negative**

3  
3-BETA-HYDROXYSTEROID DEHYDROGENASE TYPE II DEFICIENCY (*HSD3B2*) **negative**  
3-HYDROXY-3-METHYLGLUTARYL-COENZYME A LYASE DEFICIENCY (*HMGCL*) **negative**  
3-HYDROXYACYL-COA DEHYDROGENASE DEFICIENCY (*HADH*) **negative**  
3-METHYLCROTONYL-CoA CARBOXYLASE 2 DEFICIENCY (*MCCC2*) **negative**  
3-PHOSPHOGLYCERATE DEHYDROGENASE DEFICIENCY (*PHGDH*) **negative**

5  
5-ALPHA-REDUCTASE DEFICIENCY (*SRD5A2*) **negative**

6  
6-PYRUVYL-TETRAHYDROPTERIN SYNTHASE ( *PTPS* ) DEFICIENCY (*PTS*) **negative**

**A**  
ABCA4-RELATED CONDITIONS (*ABCA4*) **negative**  
ABETALIPOPROTEINEMIA (*MTPP*) **negative**  
ACHONDROGENESIS, TYPE 1B (*SLC26A2*) **negative**  
ACHROMATOPSIA, CNGB3-RELATED (*CNGB3*) **negative**  
ACRODERMATITIS ENTEROPATHICA (*SLC39A4*) **negative**  
ACTION MYOCLONUS-RENAL FAILURE (AMRF) SYNDROME (*SCARB2*) **negative**  
ACUTE INFANTILE LIVER FAILURE, TRMU-RELATED (*TRMU*) **negative**  
ACYL-COA OXIDASE I DEFICIENCY (*ACOX1*) **negative**  
AICARDI-GOUTIÈRES SYNDROME (*SAMHD1*) **negative**  
AICARDI-GOUTIERES SYNDROME, RNASEH2A-RELATED (*RNASEH2A*) **negative**  
AICARDI-GOUTIERES SYNDROME, RNASEH2B-RELATED (*RNASEH2B*) **negative**  
AICARDI-GOUTIERES SYNDROME, RNASEH2C-RELATED (*RNASEH2C*) **negative**  
AICARDI-GOUTIÈRES SYNDROME, TREX1-RELATED (*TREX1*) **negative**  
ALPHA-MANNOSIDOSIS (*MAN2B1*) **negative**  
ALPHA-THALASSEMIA (*HBA1/HBA2*) **negative**  
ALPORT SYNDROME, COL4A3-RELATED (*COL4A3*) **negative**  
ALPORT SYNDROME, COL4A4-RELATED (*COL4A4*) **negative**  
ALSTROM SYNDROME (*ALMS1*) **negative**  
AMISH INFANTILE EPILEPSY SYNDROME (*ST3GAL5*) **negative**  
ANDERMANN SYNDROME (*SLC12A6*) **negative**  
ARGININE:GLYCINE AMIDINOTRANSFERASE DEFICIENCY (AGAT DEFICIENCY) (*GATM*) **negative**  
ARGININEMIA (*ARG1*) **negative**  
ARGININOSUCCINATE LYASE DEFICIENCY (*ASL*) **negative**  
AROMATASE DEFICIENCY (*CYP19A1*) **negative**  
ASPARAGINE SYNTHETASE DEFICIENCY (*ASNS*) **negative**  
ASPARTYLGLYCOSAMINURIA (*AGA*) **negative**  
ATAXIA WITH VITAMIN E DEFICIENCY (*TTPA*) **negative**  
ATAXIA-TELANGIECTASIA (*ATM*) **negative**  
ATAXIA-TELANGIECTASIA-LIKE DISORDER 1 (*MRE11*) **negative**  
ATRANSFERRINEMIA (*TF*) **negative**  
AUTISM SPECTRUM, EPILEPSY AND ARTHROGRYPOSIS (*SLC35A3*) **negative**  
AUTOIMMUNE POLYGLANDULAR SYNDROME, TYPE 1 (*AIRE*) **negative**  
AUTOSOMAL RECESSIVE CONGENITAL ICHTHYOSIS (*ARCI*), *SLC27A4*-RELATED (*SLC27A4*) **negative**  
AUTOSOMAL RECESSIVE SPASTIC ATAXIA OF CHARLEVOIX-SAGUENAY (*SACS*) **negative**

**B**  
BARDET-BIEDL SYNDROME, ARL6-RELATED (*ARL6*) **negative**

BARDET-BIEDL SYNDROME, BBS10-RELATED (*BBS10*) **negative**  
BARDET-BIEDL SYNDROME, BBS12-RELATED (*BBS12*) **negative**  
BARDET-BIEDL SYNDROME, BBS1-RELATED (*BBS1*) **negative**  
BARDET-BIEDL SYNDROME, BBS2-RELATED (*BBS2*) **negative**

**Testing Methodology, Limitations, and Comments:****Next-generation sequencing (NGS)**

Sequencing library prepared from genomic DNA isolated from a patient sample is enriched for targets of interest using standard hybridization capture protocols and PCR amplification (for targets specified below). NGS is then performed to achieve the standards of quality control metrics, including a minimum coverage of 99% of targeted regions at 20X sequencing depth. Sequencing data is aligned to human reference sequence, followed by deduplication, metric collection and variant calling (coding region +/- 20bp). Variants are then classified according to ACMGG/AMP standards of interpretation using publicly available databases including but not limited to ENSEMBL, HGMD Pro, ClinGen, ClinVar, 1000G, ESP and gnomAD. Variants predicted to be pathogenic or likely pathogenic for the specified diseases are reported. It should be noted that the data interpretation is based on our current understanding of the genes and variants at the time of reporting. Putative positive sequencing variants that do not meet internal quality standards or are within highly homologous regions are confirmed by Sanger sequencing or gene-specific long-range PCR as needed prior to reporting.

Copy Number Variant (CNV) analysis is limited to deletions involving two or more exons for all genes on the panel, in addition to specific known recurrent single-exon deletions. CNVs of small size may have reduced detection rate. This method does not detect gene inversions, single-exonic and sub-exonic deletions (unless otherwise specified), and duplications of all sizes (unless otherwise specified). Additionally, this method does not define the exact breakpoints of detected CNV events. Confirmation testing for copy number variation is performed by specific PCR, Multiplex Ligation-dependent Probe Amplification (MLPA), next generation sequencing, or other methodology.

This test may not detect certain variants due to local sequence characteristics, high/low genomic complexity, homologous sequence, or allele dropout (PCR-based assays). Variants within noncoding regions (promoter, 5'UTR, 3'UTR, deep intronic regions, unless otherwise specified), small deletions or insertions larger than 25bp, low-level mosaic variants, structural variants such as inversions, and/or balanced translocations may not be detected with this technology.

**SPECIAL NOTES**

For ABCC6, sequencing variants in exons 1-7 are not detected due to the presence of regions of high homology.

For CFTR, when the CFTR R117H variant is detected, reflex analysis of the polythymidine variations (5T, 7T and 9T) at the intron 9 branch/acceptor site of the CFTR gene will be performed. Multi-exon duplication analysis is included.

For CYP21A2, targets were enriched using long-range PCR amplification, followed by next generation sequencing. Duplication analysis will only be performed and reported when c.955C>T (p.Q319\*) is detected. Sequencing and CNV analysis may have reduced sensitivity, if variants result from complex rearrangements, in trans with a gene deletion, or CYP21A2 gene duplication on one chromosome and deletion on the other chromosome. This analysis cannot detect sequencing variants located on the CYP21A2 duplicated copy.

For DDX11, sequencing variants in exons 7-11 and CNV for the entire gene are not analyzed due to high sequence homology.

For GJB2, CNV analysis of upstream deletions of GJB6-CRYL1 critical region is included.

For HBA1/HBA2, CNV analysis is offered to detect common deletions of -alpha3.7, -alpha4.2, --MED, --SEA, --FIL, --THAI, --alpha20.5, and/or HS-40. Sequencing and CNV analysis may have reduced sensitivity due to high sequence homology.

For OTOA, sequencing variants in exons 25-29 and CNV in exons 21-29 are not analyzed due to high sequence homology.

For RPGRIP1L, variants in exon 23 are not detected due to assay limitation.

For SAMD9, only p.K1495E variant will be analyzed and reported.

Ordering Physician: [REDACTED]

Clinic Information: Fairfax Cryobank

Report Date: 09/22/2025

**Friedreich Ataxia (FXN)**

The GAA repeat region of the FXN gene is assessed by trinucleotide PCR assay and capillary electrophoresis. Variances of +/-1 repeat for normal alleles and up to +/-3 repeats for premutation alleles may occur. For fully penetrant expanded alleles, the precise repeat size cannot be determined, therefore the approximate allele size is reported. Sequencing and copy number variants are analyzed by next-generation sequencing analysis.

**Friedreich Ataxia Repeat Categories**

Categories	GAA Repeat Sizes
Normal	<34
Premutation	34 - 65
Full	>65

**Spinal Muscular Atrophy (SMN1)**

The total combined copy number of SMN1 and SMN2 exon 7 is quantified based on NGS read depth. The ratio of SMN1 to SMN2 is calculated based on the read depth of a single nucleotide that distinguishes these two genes in exon 7. In addition to copy number analysis, testing for the presence or absence of a single nucleotide polymorphism (g.27134T>G in intron 7 of SMN1) associated with the presence of a SMN1 duplication allele is performed using NGS.

Ethnicity	Two SMN1 copies carrier risk before g.27134T>G testing	Carrier risk after g.27134T>G testing	
		g.27134T>G ABSENT	g.27134T>G PRESENT
Caucasian	1 in 632	1 in 769	1 in 29
Ashkenazi Jewish	1 in 350	1 in 580	LIKELY CARRIER
Asian	1 in 628	1 in 702	LIKELY CARRIER
African-American	1 in 121	1 in 396	1 in 34
Hispanic	1 in 1061	1 in 1762	1 in 140

**Variant Classification**

Only pathogenic or likely pathogenic variants are reported. Other variants including benign variants, likely benign variants, variants of uncertain significance, or inconclusive variants identified during this analysis may be reported in certain circumstances. Our laboratory's variant classification criteria are based on the ACMG and internal guidelines and our current understanding of the specific genes. This interpretation may change over time as more information about a gene and/or variant becomes available. Natera and its lab partner(s) may reclassify variants at certain intervals but may not release updated reports without a specific request made to Natera by the ordering provider. Natera may disclose incidental findings if deemed clinically pertinent to the test performed.

**Negative Results**

A negative carrier screening result reduces the risk for a patient to be a carrier of a specific disease but does not completely rule out carrier status. Please visit <https://www.natera.com/panel-option/h-all/> for a table of carrier rates, detection rates, residual risks and promised variants/exons per gene. Carrier rates before and after testing vary by ethnicity and assume a negative family history for each disease screened and the absence of clinical symptoms in the patient. Any patient with a family history for a specific genetic disease will have a higher carrier risk prior to testing and, if the disease-causing mutation in their family is not included on the test, their carrier risk would remain unchanged. Genetic counseling is recommended for patients with a family history of genetic disease so that risk figures based on actual family history can be determined and discussed along with potential implications for reproduction. Horizon carrier screening has been developed to identify the reproductive risks for monogenic inherited conditions. Even when one or both members of a couple screen negative for pathogenic variants in a specific gene, the disease risk for their offspring is not zero. There is still a low risk for the condition in their offspring due to a number of different mechanisms that are not detected by Horizon including, but not limited to, pathogenic variant(s) in the tested gene or in a different gene not included on Horizon, pathogenic variant(s) in an upstream regulator, uniparental disomy, de novo mutation(s), or digenic or polygenic inheritance.

**Additional Comments**

These analyses generally provide highly accurate information regarding the patient's carrier status. Despite this high level of accuracy, it should be kept in mind that there are many potential sources of diagnostic error, including misidentification of samples, polymorphisms, or other rare genetic variants that interfere with analysis. Families should understand that rare diagnostic errors may occur for these reasons.
